

Model Answer: Winter-2017

Subject: Strength of Materials

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more importance. (Not applicable for subject English and Communication Skills.)
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by the candidate and those in the model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and the model answer.
- 6) In case of some questions credit may be given by judgment on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q.1	a)	Attempt any <u>SIX</u> of the following:		(12)
	i)	Define ductility and malleability.		
	Ans.	Ductility: It is the property of material due to which it can be drawn into thin wires on application of tensile force.	01	02
		Malleability: It is the property of a material by virtue of which it can be beaten up into thin sheets without cracking when hammered.	01	
	ii)	Define Principal plane and Principal stress.		
	Ans.	Principal plane: A plane which carries only normal stress and no shear stress is called Principal plane.	01	02
		Principal stress: The magnitude of normal stress acting on the principal plane is called Principal stress.	01	
	iii)	Write the equation for M.I. of Hollow shaft section.		
		Hollow Shaft:		
	Ans.	M.I.= $\frac{\pi}{64} (D^4 - d^4)$ Where, D = External Daimeter d = Internal Daimeter	02	02

Q.1	vii)	State relation between Hoop stress and Longitudinal stress, for thin cylinder.		101uIR5
	Ans.	$\sigma_{\rm C} = 2\sigma_{\rm L}$		
		Where,	02	
		Hoop Stress $(\sigma_{\rm C}) = \frac{\rm Pd}{2t}$	02	02
		Longitudinal stress $(\sigma_L) = \frac{Pd}{4t}$		
	viii)	Define core of section. Write its value for a circular section.		
		Core of section:		
	Ans.	For no tension condition the load must lie within the middle third shaded area of eccentricity 2e is called core of section. The stress produced is only compressive stress.	01	02
		For circular section the core of section is		
		$2 e = \frac{D}{4}$	01	
		Where,		
		e = Eccentricity of circular section D = Diameter of circular section		
		D = Diameter of circular section		
	b)	Attempt any <u>TWO</u> of the following:		(08)
	(i)	For a round bar of 50 mm diameter and 2.5 m long of certain material has Young's modulus of $1.1 \times 10^5 \text{ N/mm}^2$ and Modulus of rigidity of 0.45 x 10^5 N/mm^2 . Find the Bulk modulus and the lateral contraction of the bar when stretched by 3 mm.		
	Ans.	Given:		
	Alls.	$d = 50 \text{mm}, \qquad L = 2.5 \text{m}$		
		$E = 1.1 \times 10^{5} N / mm^{2}, G = 0.45 \times 10^{5} N / mm^{2},$ $\delta L = 3 mm$		
		Find : K , δd		
		$\mathbf{E} = 2\mathbf{G}\left(1+\mu\right)$		
		$1.1 \times 10^{5} = 2 \times 0.45 \times 10^{5} (1 + \mu)$		
		$\frac{\mu = 0.22}{\mu = 2K(1 - 2)}$	01	
		$E = 3K(1 - 2\mu)$ 1.1×10 ⁵ = 3×K(1-2×0.22)		
		$K = 65476.190 N / mm^2$		
		$\mathbf{K} = 0.65 \times 10^5 N / mm^2$	01

Q.4	e) Ans.	Explain the meaning of moment of resistance and neutral axis in the theory of simple bending. Moment of resistance: Moment of resistance of the beam is the moment of couple formed by the total compressive force acting at the Centre of gravity of the compressive stress diagram and the total tensile force acting at the Centre of gravity of the tensile stress diagram. Moment of couple = C x Z or T x Z. This moment is called the moment of resistance of the beam and is denoted by M_r .	01	
		y_{c} y_{c} y_{c} $Neutral$ $Axis$ $Lever arm = Z$ y_{t} $\frac{y_{t}}{y_{t}}$ $\frac{y_{t}}{y_{t}}$	01	04
		Neutral Axis: The fibers in the lower part of the beam undergo elongation while those in the upper part are shortened. These changes in the lengths of the fibers set up tensile and compressive stresses in the fibers. The fibers in the centroidal layer are neither shortened nor elongated. These centroidal layers which do not undergo any extension or compression is called neutral layer or neutral surface. When the beam is subjected to pure bending there will always be one layer which will not be subjected to either compression or tension. This layer is called as neutral layer and axis of this layer is called Neutral Axis.	01	
		Tension zone Compression zone	01
