

# WINTER-17 EXAMINATION

## Subject Name: Relational Database Management System <u>Model Answer</u> Subject Code: 17332

### Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No.	Sub Q. N.	Answer				
1.	(a)	Attempt any SIX	of the following :		Marks 12	
	(i)	List any four DBM	AS software.		2M	
	Ans:	Oracle, MySQL, N	icrosoft SQL Server, IBM DB2, FoxPro	(Any 4 Softwares: ½ mark each)		
	(ii)	List and draw any	y four symbols used	d in ER model.	2M	
	Ans:		Symbol	Use         Entity         Weak Entity         Relationship         Weak Relationship	(Any 4 symbols: ½ mark each)	

### MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION (Autonomous) (ISO/IEC - 27001 - 2013 Certified)

Attribute	
Multivalued Attribute	
Primary key Attribute	
Derived Attribute	
Composite Attribute	_
Define normalization.	2M
Normalization can be defined as process of decomposition of database tables to avoid the data redundancy.	(Definition: 2 marks)
Define domain and entity.	2M
<ul> <li>Domain: All permissible values of attributes is called as a domain.</li> <li>Entity: An entity is a thing or object in the real world with an independent existence. An entity may be an object with a physical existence.</li> </ul>	(Domain : 1 mark; Entity: 1 mark)
List any four DCL commands.	2M
<ol> <li>GRANT</li> <li>REVOKE</li> <li>SAVE POINT</li> <li>ROLLBACK</li> <li>COMMIT</li> </ol>	(Any 4 DCL Commands :½ mark each)
Draw the state diagram of transaction.	2M
active tailed aborted	(Correct diagram: 2 marks)
	Attribute Multivalued Attribute Primary key Attribute Derived Attribute Derived Attribute Composite Attribute Define normalization. Normalization can be defined as process of decomposition of database tables to avoid the data redundancy. Define domain and entity.  Define domain and entity.  Define domain: All permissible values of attributes is called as a domain.  Entity: An entity is a thing or object in the real world with an independent existence. An entity may be an object with a physical existence. List any four DCL commands.  I. GRANT REVOKE S. COMMIT Draw the state diagram of transaction.

(vii)	Explain the use of truncate statement. Gi	ive example.	2M			
Ans:	TRUNCATE statement removes all rows from a table, but the table structure and its columns, constraints, indexes, and so on remain.         Syntax: - TRUNCATE TABLE TABLE_NAME;					
	<b>Example:</b> TRUNCATE TABLE STUDEN	Τ;				
(viii)	State statement used in PL/SQL to displa	ay the output with syntax.	2M			
	The statement used in PL/SQL to display or <b>Syntax</b> : dbms output.put line(var/msg);	utput is:	(Correct statement: 2 marks)			
 (b)	Attempt any TWO of the following :		Marks 8			
(i)	State four differences between DBMS an	d RDBMS.	4M			
Ans:			(Any 4 points of			
	DBMS	RDBMS	differences:			
	Old version of software to handle the databases.	Latest version of software for handling databases.	1 mark each)			
	Can relate one table to another table.	RDBMS can relate one database to another database.				
	Data security is low as compare to RDBMS.	Level of data security is very high as compare to DBMS.				
	Data storage capacity is less as compare to RDBMS.	Data storage capacity is very high.				
	Not easy to maintain data integrity.	Data integrity is one of the most important features of RDBMS. It can be maintained easily in RDBMS.				
	Works better in single user or few user systems.	Works very efficiently and give good performance over the network.				
	All Codd's 12 rules are not followed.	All Codd's 12 rules are followed.				
	DBMS normalization process will not be present.	RDBMS fully support normalization				
	e.g. FoxPro, Ms-Access	e.g. SQL-server, Oracle, IBM-DB2				
(ii)	Explain Alter Command. Give syntax of	add and modify options.	4M			
Ans:	Alter Command is use to make necessary c	hanges in existing structure/schema of table. If	(Descriptio			
	a DBA/user wants to make changes in a ta	ble which was created earlier then one can use	n 2 marks, Syntax of			

	Alter command.	add: 1 mark.			
	The alter command has following 4 options.	Syntax of			
	Modify	modify: 1 mark)			
	Drop Rename	,			
	Add option: The add option is use to add new column to existing table. To add new column/attribute one can use following syntax.				
	SQL>Alter table table-name <i>add</i> attribute_name datatype(size);				
	Example:				
	SQL>Alter table student add hobby varchar2(10);				
	Add Constraints:-				
	Another use of add option is to add constraints on existing attribute. To add constraint following <b>syntax</b> is use.				
	SQL>Alter table table-name add constraint constraint_name constraint_type(list of attribute(s));				
	SQL>Alter table student add constraint pk primary key(roll_no);				
	<b>Modify option:</b> The modify option is use to modify existing column of table. To modify column/attribute one can use following <b>syntax</b> .				
	SQL>Alter table table-name <i>modify</i> attribute_name new_datatype(size);				
	Example:				
	SQL>Alter table student modify hobby varchar2(20);				
(iii)	Explain exception handling with its two types.	4M			
Ans:	Exception Handling: Exception is nothing but an error. Exception can be raise when	(Descriptio			
	DBMS encounters errors or it can be raised explicitly. When the system throws a warning or has an error it can lead to an exception. Such exception needs to be handled and can be defined internally or user defined. Exception handling is nothing but a code block in memory that will attempt to resolve current error condition.	n: 2 marks, Two types :2 marks)			
	Syntax: DECLARE : Declaration section				

		. 11	
		executable statement;	
		WHEN ex_name1 THEN	
		; Error handling statements/user defined action to be carried out;	
		END;	
		Types of Exception:	
		1) Predefined Exception/system defined exception/named exception: Are always	
		automatically raised whenever related error occurs. The most common errors that can	
		occur during the execution of PL/SOL. Not declared explicitly i.e. cursor already open	
		invalid cursor, no data found, zero divide and too many rows etc. Programs are handled by	
		system defined Exceptions.	
		2) User defined exception:	
		It must be declare by the user in the declaration part of the block where the exception is	
		used. It is raised explicitly in sequence of statements using:	
		Raise application error(Exception Number, Error Message);	
2.		Attempt any FOUR of the following :	Marks 16
	(a)	Draw neat labelled diagram of overall DBMS structure.	4M
	Ans:		(Correct
		naive users sophisticated database	Diagram:4
		(tellers, agents, appresent) users administrator web-users) programmers (analysts)	marks)
		use write use use	
		application application query administration interfaces programs tools tools	
		$\top$ $\top$ $\top$ $\top$ $\top$ $\top$ $\top$	
		complex and DM surrow DOI internation	
		Inker Die questes Later antipretes	
		application program DML compiler	
		abject code and organizer	
		engine guery processor	
		buffer manager authorization transaction	
		and integrity manager manager	
		storage manager	
		SAL P	
		disk storage disk storage	
		d ata statistical data	

(b)	Describe following keys :	4M
	(i) Primary key	
Ans:	<ul> <li>(i) Foreign key</li> <li>(i) Primary Key: <ul> <li>A primary key is an attribute in Relation that uniquely identifies the rows in relation.</li> <li>A Primary key does not hold NULL values neither redundant value.</li> <li>Example: <ul> <li>CREATE TABLE STUDENT (ROLL_NO NUMBER(3) PRIMARY KEY, NAME VARCHAR2(15));</li> </ul> </li> </ul></li></ul>	(Primary key: 2 marks, Foreign Key: 2 marks)
	(ii) Foreign Key: Foreign key is an attribute that point to primary key of other relation. Foreign key can contain redundant values.	
	OR	
	A Foreign Key is a field (or collection of fields) in one table that refers to the Primary Key in another table.	
	Syntax: CREATE TABLE TABLE_NAME (ATTR1 DATA_TYPES REFERENCES BASE_TABLE (DATATYPE),);	
	<b>Example:</b> CREATE TABLE SPORTS (S_ROLL NUMBER(3) REFERENCES STUDENT(ROLL-NO), COURSE VARCHAR2(10));	
(c)	Explain functional and transitive dependency.	4M
Ans:	Functional Dependency: A functional dependency occurs when one attribute in a relation uniquely determine another attribute. OR	(Functional Dependenc y: 2 marks; Transitive
	Let 'R' be a relation and let X and Y be any arbitrary attributes of R, then it can be said that Y is functionally dependent on X if and only if, each X value is associated with precisely one Y value. And it can be shown as $X \rightarrow Y$ . e.g. emp_id $\rightarrow$ ename meaning ename functionally dependent on emp_id.	dependency : 2 marks)
	<b>Transitive Dependency:</b> A Functional dependency is said to be transitive if it is indirectly formed by two functional dependencies. The Transitive dependency exist between $X \rightarrow Z$ if the following three Functional dependencies hold true.	
	$1.X \rightarrow Y$ 2.Y does not $\rightarrow X$ 3. Y $\rightarrow Z$ then X $\rightarrow Z$	

	The Transitive Dependency can only occur in a relation which has three or more attributes. This dependency needs to be eliminated to make relation in 3NF.	
	OR	
	If we have a primary key A and a non-key domain B and C, where C is more dependent on B than A; and B is directly dependent on A, then C can be considered transitively dependent on A.	
	Example: Consider the relation SUPPLIER (SNO, SNAME, CITY, STATUS).	
	In this dependency STATUS is dependent on CITY and CITY is functionally dependent on SNO, which shows a transitive dependency i.e. STATUS is transitively depending on SNO(i.e. via CITY).	
(d)	Explain group by, order by clause of SQL with example.	4M
Ans:	<ul> <li>Group by:</li> <li>The GROUP BY STATEMENT is used with aggregate functions (MAX, MIN, SUM, COUNT etc.) to group the result-set by one or more columns;</li> <li>Syntax:</li> <li>Select Column-Name(s) from Table-Name where condition <i>GROUP BY</i> Column-Name;</li> <li>Example:</li> <li>Select COUNT (Roll_no), Branch from Student <i>GROUP BY</i> Branch;</li> <li>Order By:</li> <li>To achieve a specific order then one can use the ORDER BY clause. ORDER BY clause allows sorting by one or more columns. Records can be displayed in ascending or descending order.</li> <li>Syntax:</li> <li>SELECT Column-Name(s) from Table-name where condition <i>ORDER BY</i> Columnname(s) asc/desc;</li> <li>Example:</li> </ul>	(Group by Clause: 2 marks; Order by clause: 2 marks)
 (e)	SELECT KULL_NU, PERCENTAGE FROM STUDENT ORDER BY PERCENTAGE;	<b>4</b> M
 (e)	Describe synonyms. How to create and drop synonym.	
Ans:	A synonym is an alias to a table, view, materialized view sequence, procedure, function. A <i>To Create Synonym following syntax is used.</i> Syntax: create synonym synonym_name for object; Example:	(Descriptio n :2 marks, creating synonym: 1 mark,

	Create <i>synonym</i> std for student; <i>To Drop Synonym following syntax is used.</i> Syntax:	Dropping Synonym :1 mark)
	Drop Synonym Synonym_name; Drop synonym std;	
(f)	Explain implicit and explicit cursors.	4M
(f) Ans:	Drop synonym std;         Explain implicit and explicit cursors.         Implicit Cursor:         Implicit cursors are automatically created by Oracle whenever an SQL statement is executed, when there is no explicit cursor for the statement.         Whenever a DML statement (INSERT, UPDATE and DELETE) is issued, an implicit cursor is associated with this statement. For INSERT operations, the cursor holds the data that needs to be inserted. For UPDATE and DELETE operations, the cursor identifies the rows that would be affected.         In PL/SQL, you can refer to the most recent implicit cursor as the SQL cursor, which always has the attributes like %FOUND, %ISOPEN, %NOTFOUND, and %ROWCOUNT. The following table provides the description of the most used attributes         Explicit cursor:         Explicit cursor sare programmer defined cursors for gaining more control over the context area. An explicit cursor should be defined in the declaration section of the PL/SQL Block. It is created on a SELECT Statement which returns more than one row.         Working with an explicit cursor for initializing in the memory Cursor cursor_name IS select_statement;         • Opening the cursor for allocating memory Open cursor name;         • Fetching the cursor for retrieving data Fetch cursor name INTO variable1,variable2;         • Closing the cursor to release allocated memory	4M (Implicit Cursor :2 marks; Explicit Cursor : 2 marks)
	Close cursor name;	

3.		Attempt any FOUR of the following :	Marks 16
	(a)	Describe data abstraction with neat diagram.	4M
	(a) Ans:	Describe data abstraction with neat diagram.         Data Abstraction:         Data abstraction can be defined as the process of hiding the complexity of data and representing the data which needs to be shown to users.         Three levels of data abstraction         View level         View 1       View 2         View 1       View 2         Conceptual       Logical         Level       STRUCTURE OF THE ENTIRE         DATABASE       DATABASE	4M (Data Abstraction description : 3 marks, Diagram:1 mark)
		<ul> <li>Explanation: <ol> <li>Physical Level: <ol> <li>It is lowest level of abstraction.</li> <li>This level defines lowest complicated data structure of database system.</li> <li>This level hidden from user.</li> <li>It defines how the data are stored.</li> </ol> </li> <li>2) Logical Level: <ol> <li>The level next to physical level is called logical level.</li> <li>This level defines what data stored in the database and what the relationships among these data are.</li> <li>Fully decides the structure of the entire database.</li> </ol> </li> <li>3) View Level: <ol> <li>This level is used to show the part of database to user.</li> <li>There is more complexity in physical as well as logical level so user should not interact with complicated database.</li> <li>So different view of database can be created for user to interact with database easily.</li> </ol> </li> </ol></li></ul>	

(b)	State an	d explain 1	NF and 2NF wi	th example.			4M
Ans:	First No	ormal Form	(1NF): A relation	tion R is said to be	e in first nor	mal form (1NF) if th	ie (1NF:2
	domain	of all attribut	tes of R are ator	nic.			marks, 2NF • 2
		~ 1.					marks)
	Exampl	e: Supplier (	sno, sname, loc	ation, pno, qty)			
		SNO	SNAME	LOCATION	PNO	QTY	
		S1	Abc	Mumbai	P1	200	
		<b>S</b> 2	Pqr	Pune	<b>P</b> 2	300	
		S3	Lmn	Delhi	P1	400	
	TT1 1	1	· 1)15 11		. , .		
	The abor 2NF.	ve relation i	s in INF as all	the domains are ha	ving atomic	value. But it is not i	n
	Second	Normal For	r <b>m (2NF):</b> A rel	ation is said to be i	n the second	normal form if it is	n
	first nor	mal form ar	id all the non k	tey attributes are fu	ally function	ally dependent on th	le
	primary	ксу.					
	Example	: In the abov	ve relation SNA	ME, LOCATION d	lepends on S	NO and QTY on	
	(SNO, Supplier	PNO) so (SNO.SNAN	o the table MELLOCATION	can be spli I) and SP(SNO.PN	t up int O.OTY) and	o two tables and the table	
	are in se	cond normal	form.	()	o, (11)		
			SP		Supplier		
	SNO	SNAME	LOCATION	SNO I	PNO	QTY	
	<b>S</b> 1	Abc	Mumbai	S1 H	21	200	
	<b>S</b> 2	Pgr	Pune	82 H	2	300	
	<mark>8</mark> 3	Lmn	Delhi	\$3 H	21	400	
						1]	
(c)	Explain	ACID prop	erties of transa	action.			4M
A max	1 Ator	- r -r	nulica that the	transactions are	atomio. It	maans that aithor a	11 (4
Ans:	<b>1.</b> Atomicity. It implies that the transactions are atomic. It means that either all transactions are executed and reflected properly in the database, or none them.					Properties:	
							1 mark
	<b>2.</b> Consistency. The consistency property of the transaction implies that if the transaction was in a consistent state before the start of the transaction, then on						e each)
	termination of transaction, the database should also be in a consistent state.						
	<b>3.</b> Isola	tion. Even	though multiple for every pair of	e transactions may f transactions Ti an	execute cond d Ti it appe	ncurrently, the system ars to Ti that either	n   Fi
	finis	hed execution	on before Ti sta	arted, or Tj started	execution a	fter Ti finished. Thu	s,

### MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION (Autonomous) (ISO/IEC - 27001 - 2013 Certified)

	each transaction is unaware of other transactions executing concurrently in the system.	
	<b>4. Durability</b> . After a transaction completes successfully, the changes it has made to the database persist, even if there are system failures.	
(d)	Consider the following schema : Depositor (ACC_no, Name, PAN, Balance) Create a view on depositor having attributes (ACC_no, PAN) where balance is greater than 1,00,000.	4M
Ans:	Create view v1 as select ACC_no, PAN from depositor where balance>100000;	(For correct command: 4marks)
(e)	Explain for loop in PL/SQL with example.	<b>4M</b>
Ans:	{{**Note: Any other relevant example shall be considered. **}} For Loop :	( Loop Explanatio
	• The FOR LOOP statement specifies a range of integers, then execute a	n : 2marks.
	sequence of statements once for each integer in the range.	Example :
	• To reverse the range, "REVERSE" keyword is used.	2marks)
	The syntax is :	
	FOR i IN lower_boundupper_bound LOOP	
	<loop_body><loop body="" statements=""></loop></loop_body>	
	END LOOP;	
	OR	
	For counter IN [reverse] lower_boundupper_bound LOOP	
	<loop body="" statements="">;</loop>	
	END LOOP;	
	Example:	
	begin	
	For a in 1020 loopoutput 10 to 20 elemets	
	dbms_output.put_line('value of a :'    a);	
	End Loop;	
	End;	
(f)	Describe shared lock and exclusive locking strategy in brief.	4M
Ans:	<b>1. Shared Lock</b> . If a transaction Ti has obtained a <b>shared-mode lock</b> (denoted by	(shared
	S) on item Q, then Ti can read, but cannot write, Q. Shared Lock is provided to the readers	lock:2
	but they are not allowed to change/ write the data or obtain exclusive lock on the object. It	exclusive

		<ul> <li>could be set for table or table row. Lock is released or unlocked at the end of transaction. To lock table in shared mode one can use following syntax: Lock table table_name in <i>Share</i> Mode;</li> <li><b>2. Exclusive Lock</b>: If a transaction Ti has obtained an <b>exclusive-mode lock</b> (denoted by X) on item Q, then Ti can both read and write Q. Exclusive Lock is provided to the writers of the data. When this lock is set on a object or transaction, it means that only writer, who has set the lock can change the data, and if other users cannot access the locked object. Lock is released at the end of change in transaction. To lock table in shared mode one can use following syntax: Lock table table_name in <i>Exclusive</i> Mode;</li> </ul>	lock: 2marks)
4.		Attempt any FOUR of the following :	Marks 16
	<b>(a)</b>	Explain any four functions of database administrator.	<b>4M</b>
	Ans:	<ul> <li>Ans: Functions of DBA:</li> <li>1. Schema Definition:</li> <li>The Database Administrator creates the database schema by executing DDL statements. Schema includes the logical structure of database table (Relation) like data types of attributes, length of attributes, integrity constraints etc.</li> <li>2. Storage structure and access method definition:</li> <li>The DBA creates appropriate storage structures and access methods by writing a set of definitions which is translated by data storage and DDL compiler.</li> <li>3. Schema and physical organization modification:</li> <li>DBA writes set of definitions to modify the database schema or description of physical storage organization.</li> <li>4. Granting authorization for data access:</li> <li>The DBA provides different access rights to the users according to their level. Ordinary users might have highly restricted access to data, while you go up in the hierarchy to the administrator, you will get more access rights.</li> <li>5. Integrity constraints specifications: Integrity constraints are written by DBA and they are stored in a special file which is accessed by database manager while updating data.</li> <li>6. Routine Maintenance:</li> <li>Some of the routine maintenance activities of a DBA is given below.</li> <li>Taking backup of database periodically</li> <li>Ensuring enough disk space is available all the time.</li> <li>Monitoring jobs running on the database.</li> <li>Ensure that performance is not degraded by some expensive task submitted by some users.</li> </ul>	(Explanatio n of any four functions: 1mark each)

<ul> <li>VARCHAR2(20) NOT NULL);</li> <li>CHECK: The constraint defines a condition that each row must satisfy. A single column can have multiple check condition.</li> <li>Syntax:- <ul> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE,</li> <li>COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME CHECK <condition>);</condition></li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> </ul> </li> <li>Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax: <ul> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE</li> <li>CONSTRAINT CONSTRAINT_NAME PRIMARY KEY):</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> </ul> </li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, CONSTRAINT_CONSTRAINT_NAME, UNIQUE);</li> </ul>		SQL>CREATE TABLE STUDENT (ROLL_NO NUMBER(5), NAME
<ol> <li>CHECK: The constraint defines a condition that each row must satisfy. A single column can have multiple check condition.</li> <li>Syntax:-         <ul> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE,</li> <li>COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME CHECK <condition>);</condition></li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> </ul> </li> <li>Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax:     <ul> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE</li> <li>CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> </ul> </li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK <i>PRIMARY KEY</i>, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> </ol>		VARCHAR2(20) NOT NULL);
<ul> <li>column can have multiple check condition.</li> <li>Syntax:- <ul> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE,</li> <li>COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME</li> <li>CHECK <condition>);</condition></li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> </ul> </li> <li>3. Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, CONSTRAINT_CONSTRAINT_NAME UNIQUE);</li> </ul>	2.	CHECK: The constraint defines a condition that each row must satisfy. A single
<ul> <li>Syntax:- CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME CHECK <condition>); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</condition></li> <li>Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT_CONSTRAINT_NAME UNIQUE);</li> </ul>		column can have multiple check condition.
CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME CHECK <condition>); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000)); 3. Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10)); 4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT_CONSTRAINT_NAME UNIQUE); Example:</condition>		Syntax:-
<ul> <li>(COLUMN_NAME DATA_TYPE,</li> <li>COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME CHECK <condition>);</condition></li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> <li>3. Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> </ul>		CREATE TABLE TABLE_NAME
COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME CHECK <condition>); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000)); 3. Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10)); 4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE); Example:</condition>		(COLUMN_NAME DATA_TYPE,
<ul> <li>CHECK <condition>);</condition></li> <li>Example: SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> <li>3. Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example: SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT_CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME
<ul> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> <li>Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> </ul>		CHECK <condition>);</condition>
<ul> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> <li><b>3.</b> Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li><b>4.</b> Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> </ul>		Example:
<ul> <li>NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL&gt;15000));</li> <li>Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE</li> <li>CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		SQL> CREATE TABLE EMP (ID NUMBER(5), NAME VARCHAR2(10), SAL
<ul> <li>3. Primary Key constraint: It is use to avoid redundant/duplicate value entry within the row of specified column in table. It restricts null values too.</li> <li>Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY); Example: SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK <i>PRIMARY KEY</i>, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		NUMBER(10) CONSTRINT CHK_SAL CHECK (SAL>15000));
<ul> <li>the row of specified column in table. It restricts null values too.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE</li> <li>CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK</li> <li>PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>	3.	Primary Key constraint: It is use to avoid redundant/duplicate value entry within
Syntax:         CREATE TABLE TABLE_NAME         (COLUMN_NAME       DATA_TYPE,         CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);         Example:         SQL> CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK         PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));         4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.         Syntax:         CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);         Example:		the row of specified column in table. It restricts null values too.
<ul> <li>CREATE TABLE TABLE_NAME</li> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE</li> <li>CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK</li> <li><i>PRIMARY KEY</i>, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		Syntax:
<ul> <li>(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK <i>PRIMARY KEY</i>, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		CREATE TABLE TABLE_NAME
<ul> <li>CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);</li> <li>Example:</li> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK <i>PRIMARY KEY</i>, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		(COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE
<ul> <li>Example: SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		CONSTRAINT CONSTRAINT_NAME PRIMARY KEY);
<ul> <li>SQL&gt; CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK <i>PRIMARY KEY</i>, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		Example:
<ul> <li>PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));</li> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		SQL> CREATE TABLE EMP (ID NUMBER (5) CONSTRAINT ID_PK
<ul> <li>4. Unique Constraint: The UNIQUE constraint uniquely identifies each record in a database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value. Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>		PRIMARY KEY, NAME VARCHAR2 (10), SAL NUMBER (10));
<ul> <li>database table. The UNIQUE and PRIMARY KEY constraints both provide a guarantee for uniqueness for a column or set of columns. It allows null value.</li> <li>Syntax:</li> <li>CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE);</li> <li>Example:</li> </ul>	4.	Unique Constraint: The UNIQUE constraint uniquely identifies each record in a
guarantee for uniqueness for a column or set of columns. It allows null value. Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE); Example:		database table. The UNIQUE and PRIMARY KEY constraints both provide a
Syntax: CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE); Example:		guarantee for uniqueness for a column or set of columns. It allows null value.
CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE, COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE); Example:		Syntax:
COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME UNIQUE); Example:		CREATE TABLE TABLE_NAME (COLUMN_NAME DATA_TYPE,
UNIQUE); Example:		COLUMN_NAME DATA_TYPE CONSTRAINT CONSTRAINT_NAME
Example:		UNIQUE);
Example.		Example:
CREATE TABLE PERSONS (P. ID NUMBER CONSTRAINT P. UK UNIQUE		Example.

	-		
	FIRSTNAME VARCHAR2(20), CITY VARCHAR2(	(20));	
	5. Referential Integrity Constraint: It is a relational database concept in which		
	multiple tables share a relationship based on the data stored in the tables, and that		
	relationship must remain consistent. A value of foreig	gn key is derived from primary	
	key which is defined in parent table.		
	Syntax:		
	CREATE TABLE TABLE_NAME (COLUI COLUMN_NAME DATA_TYPE CONSTRAIN REFERENCES PARENT_TABLE_NAME (PAREN DELETE CASCADE, COLUMN_NAME DATA_TY Example:	MN_NAME DATA_TYPE, NT CONSTRAINT_NAME T_TABLE_COL_NAME) ON 'PE);	
	CREATE TABLE DEPARTMENT (EMP_ID 1	NUMBER(5) REFERENCES	
	EMP(EMP_ID), DNO NUMBER(3));		
(d)	Explain set operators with example.		<b>4</b> M
Ans:	Set operators combine the results of two component queries	es into a single result. Queries	(Each
	containing set operators are called as compound queries. Set operators in SQL are represented with following special keywords as: Union, Union all, intersection & minus. Consider data from two tables emp1 and emp2 as		
	Emp1	Emp2	
	Ename	Ename	
	abc	pqr	
	xyz	xyz	
	lmn		
	<ul> <li>1) Union : The Union of two or more sets contains all elements, which are present in either or both. Union works as or.</li> <li>E.g. select ename from emp1 union select ename from emp2; The output considering above data is : Output:</li> </ul>		
	Ename		
	abc		
	xyz		
	lmn		
	pqr		

<u>г г</u>		$(\mathbf{A}) = \mathbf{A} $	]	
	2) Union all : The Union of 2 or more sets contains all elements, which are present in both, including duplicates.			
		E.g. select ename from emp1 union all select ename from emp2; The output considering above data is: Output:		
		Ename		
		abc		
		xyz		
		lmn		
		pqr		
		xyz		
		<ul><li>3) Intersection: The intersection of two sets includes elements which are present in both.</li><li>E.g. select ename from emp1 intersect select ename from emp2;</li><li>The output considering above data is:</li></ul>		
		Ename		
		xyz		
		<ul> <li>4) Minus: The minus of two sets includes elements from set1 minus elements of set2.</li> <li>E.g. select ename from emp1 minus select ename from emp2;</li> <li>The output considering above data is:</li> </ul>		
		Ename		
		abc		
		lmn		
(6	e)	Define index. Explain types of index.	4M	
A	Ans:	<ul> <li>Index: An index is a schema object that can speed up the retrieval of rows by using pointer. An index provides direct and fast access to rows in a table. Indexes are created explicitly Or automatically. Indexes are used to speed up searches/queries. Types of Index:</li> <li>1. Simple index</li> </ul>	(Definition: 2marks, any two types: 2 marks )	
		<ol> <li>Unique index</li> <li>Composite index</li> <li>Simple index(Single column): An index created on single column of a table is called a Simple Index.</li> </ol>		

	Syntax: Create index index_name on <tablename><column name="">; E.g.: Create index idx on employee (empno);</column></tablename>		
	2. Unique indexes are used not only for performance, but also for data integrity. A unique index does not allow any duplicate values to be inserted into the table.		
Syntax : Create unique index index_name on table_name(column_name); E.g.: Create unique index index_empno on emp(empno);			
	<b>3.</b> Composite (concatenated): Indexes that contain two or more columns from the same table which are useful for enforcing uniqueness in a table column where there's no single column that can uniquely identify a row.		
	<b>Syntax:</b> Create index index_name on <tablename><column_name1, column_name2="">;</column_name1,></tablename>		
	E.g.: Create index idx on employee (ename, empno);		
	OR		
	Automatic Index: - An index created automatically when a user defines a primary key or unique constraint in a table definition.		
	Manual Index: - User can create non – unique index on a attribute to speed up access to the rows. It has 3 types • Simple Index		
	<ul> <li>Unique Index</li> </ul>		
	Composite Index		
(f)	Write a PL/SQL program using while loop to display n even numbers.	4M	
Ans:	{{** Note: Any relevant logic can be considered**}}	(Correct	
	1. To Display even numbers till n	logic:2

5.		Attempt any FOUR of the following :	Marks 16
	(a)	Explain three tier architecture with suitable diagram.	<b>4</b> M
	Ans:	{{**Any other relevant diagram shall be considered}}	(Explanatio
		The three tier architecture includes the following:	n: 2marks,
		• Clients contain GUI interfaces and some additional application-specific business rules.	diagram:2 marks)
		• The intermediate server also known as application server accepts requests the clients,	
		processes the requests and sends database commands to the database server. It acts as	
		a conduit for passing (partially processed data from the database server to the clients,	
		when it may be processed further and filtered to be presented to users in GUI format.	
		• Thus the user interfaces, application rules and the database comprises of the three tier	
		architecture	

#### MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION (Autonomous) (ISO/IEC - 27001 - 2013 Certified)

	Client GUI web Interface Application server or Web Server Database Server DBMS	
	Figure: Three Tier Architecture	
(b)	Explain on delete cascade clause with example.	<b>4M</b>
Ans:	The term On Delete cascade referential action is used for a foreign key to delete data from multiple related tables. On delete cascade clause allows automatic deletion of child records when parent record is deleted. When a relation is created between two tables, it is permissible to delete records in child table, but a vice–versa operation is not allowed i.e. deleting records from parent table when it is referenced from some other table is not allowed. E.g. : Using Create Statement: Create table emp (ename varchar2(10), eid number(5), deptno number(10) references dept(deptno) on delete cascade); Using Alter Statement: Alter table Emp add constraint foreign key emp(deptno) references dept(deptno) on delete cascade option. So if any deletion occurs at dept table, related data get deleted from Emp table simultaneously	(Explanatio n:3 marks, example:1 mark)
(c)	Consider following schema : Employee (emp_no,emp_name, dept, salary, designation, dept_location) Solve following queries : (i) List all managers in Mumbai location. (ii) Set salary of all 'project leaders' to ₹ 70,000. (iii) List employees with having alphabet 'A' as second letter in their name. (iv) Display details of those employees who work in Mumbai or Chennai.	4M

Ans:	i) SQL> Select emp_name from Employee where designation='manager' and dept_location= 'Mumbai':	Each correct
	ii) SQL> Update Employee Set salary = 70000 Where designation = 'project leader';	
		Imark
	111) SQL> Select emp_name from Employee where emp_name like $^{-}A\%$ ;	eacn)
	$N$ SQL> Select ' from Employee where dept_location in ( Mumbai , Chennai );	
	ON SOL > Select * from Employee where dent location='Mumbai' or	
	dent location='Chennai':	
(d)	Describe Grant and Revoke commands.	4M
Ans.	1 GRANT is a DCL command used to provide access or privileges on the database	(Evplanatio
Ans.	object to the users	(Explanatio
	Syntax of GRANT command:	command
	GRANT privilege name	with syntax
	ON object name	or example.
	TO {user_name  PUBLIC  role_name}	2 marks
	[WITH GRANT OPTION]:	each)
	Example: Grant update, select on emp to u1	cucity
	2. REVOKE is also a DCL command which removes user access rights or privileges	
	to the database objects.	
	Syntax of REVOKE command	
	REVOKE privilege_name	
	ON object_name	
	FROM {user_name  PUBLIC  role_name};	
	Example: Revoke update on emp from u1;	
(e)	Define sequences. Create sequence for student table.	4M
<b>A</b> 10 00 0	A Sequence is a user erected detahase chiest. It is used to concrete unique integers. The	Definitions
Ans:	A sequence is generated and incremented or decremented by an internal oracle routine. This	(Definition: 2morbs
	save a time reduces application code. Sequence numbers are stored and generated	2mar KS, Croating: 2
	independently of tables. It can be used for multiple tables	marks)
	1) Syntax to Create a sequence :	mai ksj
	Create sequence < sequence name >	
	[Incremented by <integer value="">][start with <integer value="">][ Maxvalue <integer< th=""><th></th></integer<></integer></integer>	
	value>]	
	[minvalue <integer value="">][cycle/ nocycle];</integer>	
	INCOEMENT DV. Specifies the interval between sequence numbers. It can be env	
	nocket with the specifies the interval between sequence numbers. It can be any positive or positive value but not zero. If this clause is emitted the default value is 1	
	positive of negative value out not zero. If this clause is offitted the default value is 1.	
	MINIVALUE: Specifies the sequence minimum value.	
	MAXVALUE: Specifies the maximum value that a sequence can generate.	
	<b>CYCLE:</b> Specifies that the sequence continues to generate repeat values after reaching either its maximum.	
		1

		<b>NOCYCLE:</b> Specifies that a sequence cannot generate more values after reaching the maximum value.			
		Create sequence addr_sqe increment by 1 start with 1 minvalue 1 maxvalue 999 cycle;			
		To Create sequence for student Table:			
		SQL> Create sequence stud_seq start with 1	l increment by 1 maxvalue 50 nocycle;		
	(f)	Define database trigger. Compare databa	ase trigger and procedures.	<b>4M</b>	
		Database trigger is a PL/SQL block that is e is related to a particular data manipulation of updating a row of a table. Syntax: CREATE [OR REPLACE ] TRIGGER trig {BEFORE   AFTER   INSTEAD OF } {INSERT [OR]   UPDATE [OR]   DELETH [OF col_name] ON table_name [REFERENCING OLD AS o NEW AS n] [FOR EACH ROW] WHEN (condition) BEGIN sql statements END;	executed on an event in the database. The event of a table such as inserting, deleting or gger_name E}	(Definition: 2marks, Compariso n: 2marks)	
		Comparison between	triggers and procedures		
	1 riggers Procedures				
		Triggers are called implicitly by oracle	Procedures are called explicitly.		
		Trigger can only be executed whenever an event (insert, delete, and update) is fired on the table on which it is defined.	Procedure can be executed whenever it is needed with the help of the exec command,		
		Trigger does not require parameters for execution	Procedure can take input parameters		
		Trigger returns exception or status of current event.	Procedures may return values		
		Triggers cannot be scheduled like	Procedures can be scheduled through		
		procedures	a job to execute on a predefined time		
6.		Attempt any FOUR of the following :		Marks 16	
	(a)	Describe data mining and data warehous	ing.	<b>4</b> M	
	Ans:	1. Data Mining:		(Data	
		The process of extracting valid, previous information from large databases and using as Data Mining.	sly unknown, comprehensible, and actionable it to make crucial business decisions is known of data and the use of software techniques for	Mining :2marks , Data Warebouse	
		with the analysis	or and the use of software teeningues for	marchouse	

	finding hidden and unexpected patterns and relationships in sets of data. The focus of data mining is to find the information that is hidden and unexpected.			
	2 Data Warehouse.			
	Data warehouse is defined as "A subject-oriented, integrated, time-variant, and nonvolatile			
	collection of data in support of management's decision-making process."			
	Data warehouse contains huge amount of data w	hich can be in structured, semi structured		
	or unstructured fashion. In Data warehouse the v	volume of data is considered and in most		
	of the case the size of data is in XETABYTE.			
(b)	Explain any 4 types of attributes.		4M	
Ans:	Types of attributes:		(Any Four	
	1. Simple attributes: An attributes which cann	ot be divided into subparts are known as	attributes:	
	Simple attributes. E.g. RollNo.	-	1mark	
	2. Composite attributes: It can be further divid	ed into subparts (that is, other attributes).	each)	
	e.g Name can be divided as First_name,Midd	le_name,Last_name		
	3. Single-valued attribute: The attributes that	hold a single value for a single entity are		
	single-valued attributes. E.g. Branch			
	4. Multivalued attributes: There may be instan	ices where an attribute has a set of values		
	for a specific entity. E.g. TelephoneNo			
	5. Derived attributes: The value for such attribut	te can be derived from the values of other		
	related attributes or entities. E.g. Age attribute	e can be derived from attribute DOB		
	<b>6.</b> Key attributes: An attribute which denotes t	he primary key of an entity set. example-		
(a)	student_enrollment_no in student table.			
(0)	Explain drop and delete commands with syntax. State the difference between them.			
Ans:	Drop command:         When we need to delete a database object from a database the SQL DROP statement is use to remove such database object with its structure. This command also removes all data indexes, triggers constraints and permissions and specifications for those object. Syntax:         Drop dabase_object <object name="">;         Example:         Drop table emp;         Drop sequence sq1;         Delete Command:         Delete command is used to delete the rows in the table. DELETE removes one or more records from given table.         Syntax:         DELETE from<table_name> [where <conditions>];         Delete From student where roll_no = 1234;</conditions></table_name></object>			
	<pre>indexes, triggers constraints and permissions and Syntax: Drop dabase_object <object name="">; Example: Drop table emp; Drop sequence sq1; Delete Command: Delete command is used to delete the rows in the records from given table.
