**Important Instructions to examiners:**

1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate’s answers and model answer.
6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate’s understanding.
7) For programming language papers, credit may be given to any other program based on equivalent concept.

State the meaning of terms ‘governing’ and ‘compounding’ of steam turbines.

- **Governing**: Steam turbine governing is the procedure of controlling the flow rate of steam to a steam turbine so as to maintain its speed of rotation as constant.

- **Compounding**: The arrangement to reduce pressure from boiler pressure to condenser pressure by use of multiple system of rotors in series, keyed to common shaft or by increasing number of stages and the steam pressure or steam velocity is absorbed in stages as it flows over moving blades. This is known as compounding.

Write continuity equation of steam nozzle and state the meaning of each term.

It is the passage of varying cross sectional area in which heat energy of fluid is converted into kinetic energy.

Applying S. F. E. E,

\[ Q + h_1 + gZ_1 + (1/2)C_1^2 = W + h_2 + gZ_2 + (1/2)C_2^2 \]

Since \( Q = 0 \), \( Z_1 = Z_2 = 0 \), \( W = 0 \) where,

\[ h_1 - h_2 = (C_2^2/2) - (C_1^2/2) \]

\[ 2(h_1 - h_2) = C_2^2 - C_1^2 \]

\[ C_2 = \sqrt{2(h_1-h_2) + C_1^2} \]

Where,

- \( C_1 \): Velocity at inlet
- \( C_2 \): Velocity at exit
- \( h_1 \): enthalpy at inlet
- \( h_2 \): enthalpy at exit

Define condenser efficiency.

*Ans:*

it is defined as the ratio of temperature rise of cooling water to the vacuum temperature minus inlet cooling water temperature.

\[
\text{Condenser efficiency} = \frac{\text{Temp. rise of cooling water}}{\text{Vacuum temp. } - \text{Inlet cooling water temp.}}
\]

Where,

- \( t_o \) - Outlet temp. of cooling water.
- \( t_i \) - Inlet temp. of cooling water.
- \( t_v \) - Vacuum temp. It is the saturation temp. Corresponding to the condenser pressure.

Define following terms:

1) Dryness fraction
2) Degree of superheat
3) Dry saturated steam
4) Superheated steam

*Ans: 1) Dryness fraction:* It is defined as a fraction of steam that is in vapour form in liquid vapour is called dryness fraction.
Where \( x \) – Dryness fraction
\( M_v \) – mass of vapour (dry steam) contain in steam
\( M_L \) = mass of water in suspension in steam

Dryness fraction is ratio of the mass of actual dry steam to the mass of wet steam.

2) **Degree of superheat**: It is the difference between the temperature of superheated vapour & saturation temperature corresponding at given pressure. is said to be degree of superheat.
Degree of superheat = \( (T_{sup} - T_{sat}) \)

3) **Dry saturated steam**
It is defined as the quality of heat required to raise the temperature of one kilogram of water from freezing point to temperature of evaporation to convert it into dry saturated steam at that temperature & pressure.
\[ H_s = H_f + H_{fg} \]
Where \( H_s \) enthalpy of dry saturated steam
\( H_f \) = sensible heat
\( H_{fg} \) = latent heat of evaporation

The quantity of heat required to convert 1 kg of water at 0°C into dry saturated steam at constant pressure is known as enthalpy of dry saturated steam.

4) **Superheated steam**
An amount of heat required to one kg of water from freezing temperature into superheated steam is called enthalpy of superheated steam.
\[ H_{sup} = H_f + H_g + C_{vs}(T_{sup} - T_{sat}) \]
Where \( H_{sup} \) = enthalpy of superheated steam
\( H_f \) = sensible heat
\( H_g \) = latent heat
\( C_{vs} \) = specific heat of superheated vapour
\( T_{sat} \) – saturated temperature

The quantity of heat required to convert 1 kg of water at 0°C into superheated steam at constant pressure is known as enthalpy of superheated steam.

**ii**

State Dalton’s law of partial pressures. Apply it to steam condenser with the help of suitable diagram.

**Ans: Dalton’s law of partial pressure**: This law states that “The total pressure exerted by a mixture of air and water vapour on the walls of container is the sum of partial pressure exerted by air separated and that exerted by vapour separately at common temperature of the condenser”. If there were no air present in the condenser the total pressure in the condenser would be equal to partial pressure of steam corresponding to temperature of condenser and in this case maximum vacuum would be obtained in the condenser.

Hence, practically, the total pressure in the condenser is sum of partial pressures of exhaust steam and air present in the condenser.

\[ P = Pa + Ps \]

Where
\( P_a \) = partial pressure exhausted by air
\( P_s \) = partial pressure exhausted by vapour
\( P \) = total pressure of mixture at temperature.
Define black body, grey body, emissivity, absorptivity.

Ans:

**Black body:** A body which absorbs all the incident radiation is called black body irrespective of its colour. For black body condition is $\alpha = 1$, $\beta = 0$, $\tau = 0$.

**Grey body:** If the body absorbs a definite percentage of incident radiation irrespective of their wavelengths, the body is known as ‘grey body’.

**Emissivity:** It is defined as total emissive power to total emissive power of a black surface, at the same temperature.

**Absorptivity:** It is defined as the ratio of amount of energy absorbed to amount of energy incident on a body

OR

Fraction of total energy absorbed by the body is called Absorptivity.

**Attempt any FOUR of the following**

**a** Differentiate between heat engine and heat pump. (any four points)

<table>
<thead>

**b** A tank of 2.2 m³ capacity contains air at 260°C and 0.1 MPa. Some air is taken from the tank without changing temperature until pressure becomes 4 KPa. Calculate:

(i) Mass of air left in the tank.

(ii) Mass of air pumped out. (take $R$ = 0287 KJ/Kg°K)

Ans: Given
V₁ = 2.2 m³,
T₁ = 260°C,
P₁ = 0.1 MPa,
P₂ = 4 KPa
Tank volume and air temperature remains constant as tank capacity will not change.
P₁V₁ = m₁RT₁
m₁ = P₁V₁ / RT₁
m₁ = (0.1 * 10³ * 2.2) / (0.287 * (260 + 273))
m₁ = 1.438 Kg
m₂ = P₂V₂ / RT₂
m₂ = (4 * 2.2) / (0.287 * (260 + 273))
m₂ = 0.05752 Kg

hence,
i) Mass of air left in the tank = 1.438 Kg
ii) Mass of air pumped out = 0.05752 Kg

What is boiler draught? State various types of boiler draughts with meaning.
Ans: The small static pressure difference which causes a flow of gas to take place is termed as a draught.

OR
The difference of pressure required to maintain the constant flow of air and to discharge the gases through the chimney to atmosphere is known as boiler draught.

OR
Boiler draught is the pressure difference, which is necessary to draw the required quantity of air for combustion and to remove the flue gases out of the boiler combustion chamber.

Necessity of boiler draught
1. To provide sufficient quantity of air for combustion.
2. To expel out the hot gases to flow through the boiler.
3. To discharge these gases to atmosphere through chimney.

Boiler draught is classified as:
1. Natural or chimney draught: draught is produced with the help of chimney alone by using pressure difference between hot flue gases inside the chimney and cold air outside the chimney.
2. Artificial draught
   a) Fan draught (Produced by mechanical fan): draught is produced with the help of fan
      i) Forced draught: fan is kept before boiler furnace.
      ii) Induced draught: fan is kept after boiler furnace and before the chimney.
      iii) Balanced draught
   b) Steam jet draught (Produced by steam jet)
      i) Induced draught
      ii) Forced draught

Compare impulse and reaction turbine on the basis of following points:
(i) Shape of blade
(ii) Admission of steam
(iii) Power generated
(iv) Speed

3. Power generated less high

4. Speed higher lower

**Enlist various losses in steam turbines.**

**Ans:**

1. Residual velocity loss
2. Loss due to friction
3. Leakage loss
4. Loss due mechanical friction
5. Radiation loss
6. Loss due to moisture

**Write steady flow energy equation and apply it to boiler and nozzle.**

**Ans:**

**steady flow energy equation**

\[ Q + h_1 + gZ_1 + \frac{1}{2} C_1^2 = W + h_2 + gZ_2 + \frac{1}{2} C_2^2 \]

**Turbine**

Fig. shows a commonly used convergent-divergent nozzle.

For this system,

\[ \Delta PE = 0 \]
\[ W = 0 \]
\[ Q = 0 \]

Applying the energy equation to the system,

\[ h_1 + \frac{C_1^2}{2} = h_2 + \frac{C_2^2}{2} \]

or \[ \frac{C_2^2}{2} - \frac{C_1^2}{2} = h_1 - h_2 \]

or \[ C_2^2 = C_1^2 + 2(h_1 - h_2) \]

\[ C_2 = \sqrt{C_1^2 + 2(h_1 - h_2)} \]

\[ \therefore \]

where velocity \( C \) is in m/s and enthalpy \( h \) in joules.
Boiler:

Assumptions:

\[ \Delta P.E = 0 \]  
\[ W = 0 \]  
\[ \Delta K.E = 0 \]

Answer:

\[ Q = h_2 - h_1 \]

heat supplied is utilized to increase enthalpy

Q3 Attempt any FOUR (4 X 4 =16)

The thermodynamic system is defined as a prescribed region, or space or finite quantity of matter surrounded by an envelope called boundary. The boundary may be real physical surface/imaginary, fixed/moving. Types of system are – [ 1 Mark]

1. Closed system (Non-flow system) – In closed system mass within the boundary of the system remains constant and only energy (i.e. heat and work) may transfer across the boundary. It can be explained with the concept of boundaries e.g. piston and cylinder arrangement without valve [ 1 Mark]

2. Open system - The system is called open if mass as well as energy (i.e. heat and work) transfer across boundaries. Such system is described with the help of control volume and control surface. e.g. steam turbine, compressor, I.C. engine [ 1 Mark]

3. Isolated system - When no flow of heat, work and mass takes place across the boundaries, the system is termed as isolated system. It can be explained with the
<table>

<td></td>
</tr>
<tr>
<td>Cochran Boiler</td>
<td></td>
<td>4</td>
</tr>
</tbody>
</table>

- Concept of boundaries e.g. Gas enclosed in insulated vessel. [1 Mark]

- Isothermal process – Constant temperature process, ideal process, and piston moves very slow.
  - It obeys the law \( PV = \text{constant} \) [2 Mark]

- Adiabatic process - No heat transfer between system and surrounding, \( dQ = 0 \)
  - Piston moves very fast, entropy remains constant in ideal adiabatic process. Work is done at the cost of internal energy. It obeys the law \( PV^Y = \text{Constant} \) [2 Mark]

- Cochran Boiler [4 Mark]
a) Nozzle control Governing of steam turbine  

The function of governing is to regulate the supply of steam to the turbine so that speed should remain constant in varying load condition. In nozzle control governing, the nozzles are made in groups and the supply of steam to each group is controlled by regulating a valve. The nozzles are divided into three groups N1, N2, N3 and respective control valves are V1, V2, V3 that control the steam supply to corresponding nozzles. The number of nozzles in a group may be three, five or ten. Under full load condition, all the regulating valves are open, when the load on the turbine is reduced, the suitable valve is closed to reduce the supply of steam.

d)

e) Comparison  

1+1+1+1
### Q4 Attempt any four

1. **Equivalence of Kelvin Plank statement and Clausius statement of Second Law of Thermodynamics**  
   [Sketch 2+Explanation 2 Mark]

   Though Kelvin Plank statement and Clausius statement of Second Law of Thermodynamics seems to be different, they are equivalent to each other. This can be proved by violating one statement leads to violation of another and vice versa. [Student can prove it by violating any one of them]

   Violation of Kelvin Plank statement:-

   Consider a heat engine having 100% efficiency (i.e. PMM-II) i.e. violating Kelvin Plank statement. Such a heat engine will convert the heat energy supplied $Q_1$ into equivalent amount of work ($W$).

   $\therefore \quad Q_1 = W$

   This work done produced can be utilized to drive a heat pump which receives amount of heat $Q_2$ from cold body (Heat sink) and rejects an amount of heat ($Q_1 + Q_2$) to hot body (Hot thermal reservoir) as shown in fig.
If combination of a heat engine and heat pump is considered as a single system, the result will be a device (Such as heat pump), which delivers $Q_2$ heat from cold body to hot body without having any external work done, which is impossible according to Clausius statement.

Hence violation of Kelvin Plank statement violates Clausius statement. Hence equivalence is proved.

Representation of Steam generation process on T-S diagram [Sketch 3+Explanation 1 Mark]

Fig shows Temperature- Entropy diagram when 1 kg of water is heated at constant pressure until the water is converted into superheated steam. The absolute temp is plotted vertically and entropy is plotted horizontally. The diagram has three regions. These are represented by two lines- water line (liquid line) and saturation line. These two lines meet at a point which is known as critical point. The temperature corresponding to this point is 374°C and 220.7 bar. [Any one diagram is acceptable]
c) Working principle of Reaction turbine with sketch. [Sketch 2+Explanation 2 Mark]

In this type of turbine, there is gradual pressure drop and takes place continuously over the fixed and moving blades. The function of fixed blades is same as nozzle. They alter the direction of steam as well they allow steam to expand to have larger velocity. As the steam passes over the moving blades K E is obtained due to fall in pressure. The steam expands while flowing over the moving blades and thus give reaction to the moving blades. Hence the turbine is known as reaction turbine. Since the pressure drop is gradual, the number of stages required are more, for the same power developed.

d) Composite wall

Data-  \( T_1 = 870^\circ C = 870 + 273 = 1143^\circ C \)
\( T_3 = 210^\circ C = 210 + 273 = 483^\circ C \)

Rate of heat flow per unit area

\[
\frac{Q}{A} = \frac{T_1 - T_3}{\frac{L1}{K1} + \frac{L2}{K2}}
\]
### Model Answer

**Subject Code:** 17410

#### Interface temperature

Heat transfer/unit area for fire clay wall

\[ \frac{Q}{A} = \frac{T_1 - T_2}{\frac{0.2}{1.039} + \frac{0.1}{0.228}} \]

\[ = 1046.124 \text{ W/m}^2 \quad [2 \text{ Mark}] \]

\[
\begin{align*}
T_2 &= 941.628 \text{ K} \\
&= 941.628 - 273 = 668.62 \text{ } ^\circ\text{C} \quad [2 \text{ Mark}]
\end{align*}
\]

#### Vacuum efficiency of Condenser

Data - Vacuum reading or actual vacuum = 710 mm of Hg
Barometer reading = 760 mm of Hg
Hot well temperature = 30 \(^\circ\)C

We know that pressure in the condenser = 760 - 710 = 50 mm of Hg
From steam tables, corresponding to a temp. of 30 \(^\circ\)C, ideal pressure of steam = 0.0424 bar = 0.00133 mm of Hg

Now, Ideal vacuum = Barometric reading – Ideal pressure

\[
= 760 - 31.88 = 728.12 \text{ mm of Hg} \quad [2 \text{ Mark}]
\]

Vacuum efficiency \( \eta_{\text{vacuum}} = \frac{\text{Actual vacuum}}{\text{Ideal vacuum}} \)

\[
= \frac{710}{728.12} = 0.9751 = 97.51\% \quad [2 \text{ Mark}]
\]

#### Enthalpy of Wet steam

\[
H_{\text{wet}} = h + x L \quad [1 \text{ Mark}]
\]

\[ h = \text{Sensible heat in KJ/Kg} \]
\[ L = \text{Latent heat in KJ/Kg} \quad ; x = \text{dryness fraction} \]

Enthalpy of Superheated steam = \( H_{\text{sup}} = h + L + C_p (T_{\text{sup}} - T_{\text{sat}}) \) \[1 \text{ Mark}\]

\[ C_p = \text{Specific heat of Superheated steam in KJ/Kg} \]
\[ T_{\text{sup}} = \text{Temperature of Superheated steam} \]
\[ T_{\text{sat}} = \text{Saturation temperature corresponding to pressure of steam generation} \]

#### Entropy of Wet steam

\[
S_{\text{wet}} = S_w + x(S_s - S_w) \quad [1 \text{ Mark}]
\]

\[ S_w = \text{Entropy of dry saturated steam} \]

Entrophy of superheated steam = \( S_{\text{sup}} = S_s + C_p \log_e \frac{T_{\text{sup}}}{T_{\text{sat}}} \) \[1 \text{ Mark}\]

**ii** Explain Zeroth law of thermodynamics.

“If two systems are each in thermal equilibrium with a third system, then the two systems are also in thermal equilibrium with one another.”

This law was enunciated by R.H. Fowler in 1931 however since the first and second law already existed at that time it was designated as Zeroth law so that it precedes the first and second law to form a logical sequence.

![Zeroth Law of Thermodynamics](image)

**Figure: Zeroth law of thermodynamics**

If System A and System C and System B and System C are thermal equilibrium with each other then system A, B are also in thermally equilibrium with each other.

**b)** Sketch and explain pressure compounded and velocity compounded impulse turbine showing pressure and velocity variations along the axis. 8 Marks
i) Pressure Compounding:

✓ Compounding is the method adopted to reduce the speed of turbine rotor at the same time to utilize internal energy of steam effectively.

✓ This method is the combination of pressure and velocity compounding to get benefit of both methods.

✓ Arrangement of blades and nozzles are made as below;

N-M-N-M-N-M

Where;  N = Nozzle

MB = Moving blade

✓ Nozzle is reduced the pressure and increase the velocity.

✓ Moving blade absorb the kinetic energy of steam.

✓ Figure shows the rings of fixed nozzles incorporated between the rings of moving blades. The steam at boiler pressure enters the first set of nozzles and expands partially. The kinetic energy of the steam thus obtain is absorbed by the moving blades (stage 1). The steam then expands partially in second set of nozzles where its pressure again falls and the velocity increases; the kinetic energy so obtained is absorbed by the second ring of moving blades (stage 2). This is repeated in stage 3 and steam finally leaves the turbine at low velocity and pressure. The number of stages depends on the number of rows of nozzles through which the steam must pass. The changes in pressure and velocity are shown in figure.

2 Marks
ii) Velocity Compounding:

- Steam expanded through nozzle from boiler to condenser pressure.
- K.E. increases of the steam increases due to increasing velocity.
- Fixed blades redirect the steam flow without altering its velocity.
- The changes in pressure and velocity are shown in figure.
- This method has advantage that the initial cost is low so its efficiency is low.
C. A certain gas has $C_p=1.968 \text{ KJ/kgK}$ and $C_V=1.507 \text{ KJ/kg K}$. Find its molecular weight and the gas constant. A constant volume chamber of 0.3 m$^3$ capacity contains 2 kg of this gas at 5$^\circ$C. Heat is transferred to the gas until the temp is 100$^\circ$C. Find work done, heat transfer and change in internal energy.

Characteristics gas constant $R$ is;

$$R = C_p - C_V$$

$$R = 1.968 - 1.507$$

$$R = 0.461 \text{ KJ/kgK}$$

Universal gas constant $R_U$ is;

$$R_U = 8.314 \text{ KJ/kg mole K}$$

$$R_U = MR$$

So, Molecular weight $M$ is;

$$M = \frac{8.314}{0.461}$$

$$M = 18.03 \text{ kg mole}$$

$T_1 = 5^\circ C = 5 + 273 = 278 \text{ K}$

$T_2 = 100^\circ C = 100 + 273 = 373 \text{ K}$

In Constant volume process i.e. Isochoric process Work done is zero.

So;

1. Workdone

$dW = 0$

2. Heat transfer

$$dQ = m \ C_V \ (T_2-T_1)$$

$$= 2 \times 1.507 \times (373 - 278)$$

$$= 286.33 \text{ KJ}$$

3. Change in Internal energy

$$\Delta U = \int (\frac{dQ}{T})$$
6. Attempt any **TWO** of the following.

### ii

Steam at 8 bar and 0.85 dry is throttled to a pressure of 1 bar.

Find final quality of steam. Use steam table.

Properties of steam from Steam table;

**At 8 bar:**

- **Specific enthalpy:**
  - $h_{f1} = 720.9 \text{ KJ/kg}$
  - $h_{fg1} = 2046.5 \text{ KJ/kg}$

- **Specific entropy:**
  - $S_{f1} = 2.0457 \text{ KJ/kgK}$
  - $S_{fg1} = 4.6139 \text{ KJ/kgK}$

**At 1 bar:**

- **Specific enthalpy:**
  - $h_{f2} = 477.5 \text{ KJ/kg}$
  - $h_{fg2} = 2257.9 \text{ KJ/kg}$

- **Specific entropy:**
  - $S_{f2} = 1.3027 \text{ KJ/kgK}$
  - $S_{fg2} = 6.0571 \text{ KJ/kgK}$
In throttling process enthalpy is constant:

\[ h_1 = h_2 \]
\[ h_{f1} + x_1 h_{fg1} = h_{f2} + x_2 h_{fg2} \]
\[ 720.9 + 0.85 \times 2046.5 = 477.5 + 2257.9 \times x_2 \]
\[ x_2 = 0.878 \]

Initial entropy:
\[ S_1 = S_{f1} + x_1 S_{fg1} \]
\[ S_1 = 2.0457 + 0.85 \times 4.613 \]
\[ S_1 = 5.966 \text{ KJ/kgK} \]

Final entropy:
\[ S_2 = S_{f2} + x_2 S_{fg2} \]
\[ S_2 = 1.3027 + 0.878 \times 6.0571 \]
\[ S_2 = 6.621 \text{ KJ/kgK} \]

At 1 bar specific entropy \( S_2 \) is between \( S_{fg} \) and \( S_g \), so quality of steam is dry.

c) Explain various modes of heat transfer with suitable example.

Modes of heat transfer: Heat transfer takes place by the following three modes.

1) Conduction
2) Convection
3) Radiation.

1) **Conduction**: Conduction is the transfer of the heat from one part of a substance to another part of same substance or from one substance to another substance in physical contact with it.

E.g. 1) Fins provided on motor cycle engine.
2) Heating a metallic rod at one end and sense the heat at other end.
2) **Convection**: Convection is the transfer of heat within a fluid by mixing of one portion of the fluid with another.

Convection is possible only in a fluid medium and is directly linked with the transport of medium itself.

E.g. Boiling water - The heat passes from the burner into the pot, heating the water at the bottom. Then, this hot water rises and cooler water moves down to replace it, causing a circular motion.

3) **Radiation**: Radiation is the transfer of heat through space or matter by means other than conduction or convection.

Radiation is heat through of as electromagnetic waves. All bodies radiate; so a transfer of heat radiation occurs because hot body emits more heat than it receive and cold body more heat than it emits. Radiation energy required no medium for transfer and will pass through vacuum.

E.g.

1) Heat from the sun warming your face
2) Heat from a light bulb
3) Heat from a fire
4) Heat from anything else which is warmer than its surroundings.
