

**Important Instruction to Examiners:-**

- 1) The answers should be examined by key words & not as word to word as given in the model answers scheme.
- 2) The model answers & answers written by the candidate may vary but the examiner may try to access the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more importance.
- 4) While assessing figures, examiners, may give credit for principle components indicated in the figure.
- 5) The figures drawn by candidate & model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credit may be given step wise for numerical problems. In some cases, the assumed contact values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgment on part of examiner of relevant answer based on candidates understanding.
- 7) For programming language papers, credit may be given to any other programme based on equivalent concept.

Q .NO	SOLUTION	MARKS																																
1 a)	<b>Attempt any six of the following</b>	<b>12 M</b>																																
i)	<b>Define geology and state any one importance in Civil Engineering.</b> <b>Geology:</b> is the science that deals with the study of the earth as a planet. Thus, it includes essence of scientific studies dealing with the origin, age and structure of the earth. 1. It is used to study different properties of rocks. 2. For any heavy construction project study of geology is required.	1 M  Any One 1 M																																
ii)	<b>State classification of rocks based on their genesis :</b> i) Igneous rock ii) Sedimentary rock iii) Metamorphic rock	2 M																																
iii)	<b>Define Faults and state any two types of it.</b> <b>Define Fault :</b> The fractures along which there has been relative movements of the blocks past each other are termed as faults. <b>Types of Fault: -</b> a) Normal Fault b) Reverse Fault.	1 M  1M																																
iv)	<b>State importance of structural geology.</b> i) Geology provides a systematic knowledge of construction materials, their structure and properties. ii) The knowledge of erosion, transportation and deposition of surface water helps in soil conservation, river control, coastal and harbor works. iii) The knowledge about the nature of the rocks is very necessary in tunneling, constructing roads and in determining the stability of cuts and slopes. iv) The foundation problems of dams, bridges and buildings are directly related with geology of the area where they are to be built.	2 M (any two)																																
v)	<b>Define a) Void Ratio b) Porosity.</b> <b>Void ratio:</b> The ratio of volume of voids (Vv) to the volume of solids ( Vs) in soil mass is called as void ratio . <b>Porosity:</b> The ratio of volume of voids ( Vv) to the total volume of soil (V) is called as Porosity.	1 M  1 M																																
vi)	<b>State field application of Geotechnical Engineering</b> In foundation design ii) In pavement design iii) In earth retaining structures iv) In design of earthen dams i) In design of embankments ii) In design of underground structures	2 M For any Two points

<b>Q. 3</b>	<b>Attempt any four of the following</b>	16
<b>3.a)</b>	<p>Find coefficient of Uniformity &amp; coefficient of curvature for soil particle.</p> $\text{Coefficient of Uniformity} = C_u = \frac{(D_{60})}{(D_{10})} = \frac{(1.30)}{(0.430)} = 3.023$ $\text{Coefficient of curvature} = C_c = \frac{(D_{30})^2}{(D_{10}) \times (D_{60})} = \frac{(0.790)^2}{(0.430) \times (1.30)} = \frac{0.6241}{0.559} = 1.11$	<p>2 M</p> <p>2 M</p>
<b>3.b</b>	<p><b>Factors affecting Permeability of Soil:-</b></p> <p><b>1. Grain Size:</b> - Permeability varies approximately as the square of the grain size. The permeability of coarse grain soil is more than fine grained soil. The permeability can be expressed as <math>k = CD_{10}^2</math>. Where 'k' is coefficient of permeability in (cm/sec) &amp; <math>D_{10}</math> is the effective grain size of soil.</p> <p><b>2. Effect of properties of Pore Fluids:-</b> The permeability is directly proportional to unit weight of water and inversely proportional to its viscosity. The unit weight of water does not change much with change in temperature but viscosity changes with change in temperature.</p> <p><b>3. Effect of void ratio:-</b> Increase in void ratio increases the area available for flow hence permeability increases for critical condition..</p> <p><b>4. Effect of structural arrangement of particles and stratification:</b> - The structural arrangement of particle may vary at the same void ratio depending upon the method of compacting of soil mass. The structure may be entirely different for a disturbed sample as compared to undisturbed sample.</p> <p><b>5. Effect of Degree of Saturation:</b> - The permeability is reduced if air is entrapped in the voids thus reducing its degree of saturation. Organic foreign matter has a tendency to move towards critical flow channel and choke them up thus decreasing the permeability.</p> <p><b>6. Effect of absorbed water:-</b> The absorbed water surrounding the fine soil particles is not free to move and reduces the effective pore spaces available for the passage of water.</p>	<p>4M (1 M each for any four points.)</p>

Q.5 a)	<p><b>CALCULATIONS</b></p> <p>i) The weight of sand (<math>W_a</math>) in gram, required to fill the calibrating container should be calculated from the formula:</p> $W_a = W_1 - W_3 - W_2$ <p>ii) The bulk density of the sand (<math>\gamma_s</math>) in <math>\text{kg/m}^3</math> should be calculated from the formula:</p> $\gamma_s = \frac{W_a}{V} \times 1000$ <p>iii) The weight of sand (<math>W_b</math>) in gram, required to fill the excavated hole should be calculated from the formula:</p> $W_b = W_1 - W_4 - W_2$ <p>iv) The bulk density (<math>\gamma_b</math>), that is, the weight of the wet soil per cubic meter should be calculated from the formula:</p> $\gamma_b = \frac{W_w}{W_b} \times \gamma_s \text{ kg/m}^3$ <p>v) The dry density (<math>\gamma_d</math>), that is, the weight of dry soil per cubic meter should be calculated from the formula:</p> $\gamma_d = \frac{100\gamma_b}{100 + w} \text{ kg/m}^3$ $\gamma_d = \frac{W_d}{W_b} \times \gamma_s \text{ kg/m}^3$	<p>1/2</p> <p>1/2</p> <p>1/2</p> <p>1/2</p> <p>1/2</p>
Q.5 b)	<b>Explain in steps laboratory method to determine plastic limit of soil sample as per IS 2720.</b>	
	 <p>The diagram illustrates the laboratory method to determine the plastic limit of a soil sample as per IS 2720. It shows a hand rolling a soil sample (3 mm diameter) on a glass plate. A separate diagram shows a glass plate with crumbled thread, a 3 mm diameter thread, and a thread with a larger diameter. A 3 mm diameter steel rod for comparison is also shown. The final diagram shows the soil sample rolled into a thread on a glass plate, with labels for crumbled thread, glass plate, and 3 mm diameter thread.</p>	<p>2M</p> <p>(1 mark for each diag.)</p>

Q .NO	SOLUTION	MARKS
Q.5 b)	i) The plastic limit of fine-grained soil is the water content of the soil below which it ceases to be plastic. It begins to crumble when rolled into threads of 3mm dia.	1
	ii) Apparatus: Porcelain evaporating dish about 120mm dia., Spatula, Container to determine moisture content, Oven, Ground glass plate – 20cm x 15cm, Rod – 3mm dia. and about 10cm long	1
	<b>PREPARATION OF SAMPLE</b>	
	ii) Take out 30g of air-dried soil from a thoroughly mixed sample of the soil passing through 425µm IS Sieve. Mix the soil with distilled water in an evaporating dish and leave the soil mass for naturing. This period may be upto 24hrs.	1
	<b>Procedure</b>	
	iii) Take about 8g of the soil and roll it with fingers on a glass plate. The rate of rolling should be between 80 to 90 strokes per minute to form a 3mm dia.	1
Q.5 c)	iv) If the dia. of the threads can be reduced to less than 3mm, without any cracks appearing, it means that the water content is more than its plastic limit. Knead the soil to reduce the water content and roll it into a thread again. Repeat the process of alternate rolling and kneading until the thread crumbles.	1
	v) Collect and keep the pieces of crumbled soil thread in the container used to determine the moisture content. Repeat the process at least twice more with fresh samples of plastic soil each time.	1
	<b>Define</b>	<b>8</b>
	i) <b>Coefficient of curvature:</b> It represents the shape of particle size distribution curve. It is given by	
	$C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$	1
	where D <sub>60</sub> is the grain diameter at 60% passing, D <sub>30</sub> is the grain diameter at 30% passing, and D <sub>10</sub> is the grain diameter at 10% passing	
ii)	C <sub>c</sub> = 1 to 3 for well graded soil	1
	C <sub>c</sub> = 4 for well graded gravel	
	C <sub>c</sub> = well graded sand	
	<b>Uniformity coefficient (Cu):</b> Is define as the ratio of D <sub>60</sub> size to D <sub>10</sub> size for given soil.	
	$C_u = \frac{D_{60}}{D_{10}}$	1
	where D <sub>60</sub> is the grain diameter at 60% passing and D <sub>10</sub> is the grain diameter at 10% passing	1

Q NO	SOLUTION	MARKS
Q.5 c) iii)	<p><b>Effective size of soil:</b> Since soil contains particles of many different diameters, it is necessary to choose some diameter as representative of the soil. This diameter is called as effective diameter or effective size.</p> <p>The diameter <math>d_{10}</math> which represents the size for which the given soil contains 10% particles finer than this size. <math>d_{10}</math> does not mean 10mm size particle.</p>	1  1
iv)	<p><b>Well graded and Uniform graded soil with the help of particle size distribution curve:</b></p>  <p>i) If a soil contains grains of all sizes in significant amount, then it is called as Well-graded soil. Such a soil will give a particle size distribution curve which is S-shaped.</p> <p>ii) A uniformly graded soil contains particles almost of only one size. Because of this, the compacted density that can be achieved is much lower for this type of soil. Uniformly graded soil is also called poorly graded soil.</p>	1  1/2  1/2
Q.6	<b>Attempt any <u>TWO</u> of the following.</b>	16
a	<p><b>Explain with neat sketch phreatic line in earthen dam with pressure head at different point and show construction points of this line.</b></p> <p>i) When flow of water occurs through soil, the top surface of the flow zone is called the phreatic surface, and in section, the top line of flow zone is called the phreatic line.</p> <p>ii) In earth retaining structures, the flow due to seepage will cause the phreatic line.</p> <p>iii) All points on the phreatic line have equal seepage pressure and it can be taken as atmospheric pressure.</p>	1  1/2  1/2

Q .NO	SOLUTION	MARKS
Q.6. a)	iv) Phreatic or seepage line is the line within a dam section below which there is positive hydrostatic pressure exist in dam and it is atmospheric on it.	1
	 <p>The diagram shows a cross-section of a homogeneous earth dam. The upstream water level is indicated by a triangle. The phreatic line is shown as a curve starting from the water level and ending at the downstream toe. The area between the phreatic line and the downstream boundary is labeled 'Seepage zone'. The entire dam body is labeled 'Homogenous Earth dam'.</p>	1
	 <p>The diagram shows a cross-section of an earth dam with a central clay core. The upstream water level is indicated by a triangle. The phreatic line is shown as a curve starting from the water level and ending at the downstream toe. The area between the phreatic line and the downstream boundary is labeled 'Seepage zone'. The clay core is labeled 'Clay core'. The entire dam body is labeled 'Earth dam with clay core'.</p>	1
	 <p>The diagram shows a cross-section of an earth dam with a sand filter and rock toe. The upstream water level is indicated by a triangle. The phreatic line is shown as a curve starting from the water level and ending at the downstream toe. The area between the phreatic line and the downstream boundary is labeled 'Seepage zone'. The sand filter is labeled 'Filter'. The downstream toe is labeled 'Toe'. The entire dam body is labeled 'Earth dam with sand filter and rock toe'.</p>	1
	v) Pressure head: The pressure at any point is given as the total head minus elevation head <div> <math display="block">H_p = H_t - (-H_e)</math> <math display="block">H_p = H_t + H_e</math> </div> <div>Where <math>H_p</math>= pressure head</div> <div><math>H_t</math>= total head</div> <div><math>H_e</math>= elevation head</div>  <p>The diagram shows a cross-section of a dam with two piezometers installed. The upstream water level is indicated by a triangle. The piezometers are shown as vertical tubes with water levels inside. The water levels in the piezometers are at the same height, labeled 'Equal level of water'. The flow lines are shown as curved arrows starting from the upstream water level and ending at the downstream toe. The entire dam body is labeled 'Flow lines'.</p>	1

Q.6.b)	iv) The settlement is observed after each load increment at 1,2.25,4,6.25,9,16,30 minutes and thereafter at hourly intervals, and is is recorded.	1/2
	v) The recording is stopped when the increase in settlement is only 0.02mm. The procedure is repeated after every increment in load	1/2
	vi) The observation are plotted on a log –log scale. The settlement in mm is plotted on X-axis and in $\text{kg/m}^2$ is plotted on Y-axis	1/2
	 <p>The figure is a log-log plot showing the relationship between Load (in <math>\text{kg/m}^2 \times 10^3</math>) on the Y-axis and Settlement (in mm) on the X-axis. Four curves are plotted, representing different soil types: (A) Loose to medium cohesionless soil, (B) Cohesive soil, (C) Partially-cohesive soil, and (D) Dense cohesionless soil. A vertical dashed line indicates the Ultimate bearing capacity.</p>	1/2
	vii) From this plot, the ultimate bearing capacity is determined. The plate load test setup is for gravity type of loading. The load increment can either be applied through gravity method or by reaction of truss method .	1/2
	<b>Limitations of plate load test:</b> <ul style="list-style-type: none"> <li>i) size effect: The actual settlement may vary from the plate weather same pressure is applied.</li> <li>ii) Time effect: As duration of test is small it does not give the ultimate settlement with respect long time.</li> <li>iii) Layer effect: If foundation is large accurate result can not be obtained by test.</li> </ul>	2 Marks ( 1 Marks each)

Q.6.c)	<b>Differentiate between compaction and consolidation and state any four factors affecting compaction.</b>		
	<b>Compaction</b>	<b>Consolidation</b>	
	i) Instant compression of soil under dynamic load is called compaction.	i) Gradual compression under a steady load is called consolidation	1/2
	ii) Takes place before building of structure	ii) Takes place after building of structure.	1/2
	iii) Fast process.	iii) Very slow process.	1/2
	iv) Carry out for improving soil property.	iv) Occurs naturally due to load of structure. Does not improve soil property.	1/2
	v) Settlement is prevented due to compaction.	v) Settlement takes place due to consolidation.	1/2
	vi) Artificial process.	vi) Natural process.	1/2
	vii) Pore water pressure not very important.	vii) Pore water pressure very important.	1/2
	viii) Does not go on indefinitely.	viii) Goes on indefinitely.	1/2
	<b>Factors affecting compaction:</b>  i) <b>Type of soil:</b> For the same compactive effort, a well graded soil can be compacted to higher MDD than a uniformly graded soil. As the grain size decreases the OMC values goes on increasing and the MDD goes on decreasing.  ii) <b>Amount of compaction :</b> If the compactive effort is increased, MDD increases and OMC decreases. But the increase in MDD is not linear with increase in energy.  iii) <b>Water content :</b> As is evident, if water content goes on increasing the maximum density of compacted soil goes on increasing upto a certain water content. If water content is further increased, the density goes on decreasing.  iv) <b>Admixtures :</b> Various admixtures like lime, calcium chloride, aggregate in various proportion etc. are used to improve the compaction properties of soil. Lime can increase the dry density by about 5to 10%		1  1  1  1
