#### **WINTER-17 EXAMINATION**

Subject Code: 17605 **Subject Name: Solid Waste Management Model Answer** 

### **Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q.	Sub	Answer	Marking
No.	Q.N.		Scheme
Q.1	(i)	Define Solid Waste	
	Ans.	Solid waste is defined as "Non soluble material that is thrown away in a solid or semi solid	
		form".	
		This includes:	(02
		Garbage	Marks)
		Refuse	
		Sludge	
		Other domestic materials as well as waste from industries, commercial, agricultural	
		and mining operations.	
Q.1	(ii)	List types of solid waste	
-	Ans.	Following are the different types of solid waste:	
		1. Domestic solid waste	
		2. Commercial solid waste	(02
		3. Industrial solid waste	Marks)
		4. Agricultural solid waste	For any
		5. Institutional solid waste	four
		6. Construction and demolition waste	
		7. Market waste	
		8.Biomedical waste	
		9. E - Waste	
Q.1	(iii)	List various transportation equipment's in solid waste management system	
	Ans.	Following are the transportation equipment's / vehicle	(02
		Animal Carts	Marks)
		Auto vehicles	For any
		Tractors and trailers	four
		Trucks	

	<u> </u>	Dumper	
		Compactor vehicles	
		Compactor venicles	
Q.1	(iv)	List methods of collection of municipal solid waste.	
	Ans.	Following are the methods of collection of municipal solid waste	
		Door to door collection.	
		Kerb System.	(02
		Alley System.	Marks)
		Back yard system.	For any
		Hauled container system.	four
		Stationary container system.	
Q.1	(v)	List the types of disposal of solid waste	
Q.I	Ans.	Following are the types of disposal of solid waste	
	Alis.	,	
		Open burning.     Dumping into the cost	(02
		Dumping into the sea.      Sanitary Londfills	(U2 Marks)
		Sanitary Landfills.	For any
		• Incineration.	four
		• Composting.	Jour
		Ploughing in fields.	
		Hog feeding.	
		Grinding and discharging into sewers.	
Q.1	(vi)	State principle of vermin composting.	
	Ans.	Vermi composting involves the stabilization of organic solid waste through earthworms	(02
		consumption which converts the material into worm casting.	Marks)
Q.1	(vii)	State principle of composting.	
	Ans.	Composting is the biological decomposition of organic waste such as food or plant material	(02
		by bacteria, fungi, worms and other organism under controlled conditions. The end result	Marks)
		of decayed organic matter is called humus.	
Q.1	(viii)	Define Biomedical waste. State its components.	
	Ans.	<b>Defination:</b> " The waste generated by hospital, nursing or meternity homes, clinics,	-
		dispensary, veterinary institutions, pathological laboratory, blood banks which is potentially	Mark)
		infectious to human health and the environment is called as biomedical waste"	
		Components:	
		Human anatomical waste.	(01
		Microbiology and biotechnology waste.	Mark)
		Waste sharps.	For any
		Discarded medicines and cyto toxic drugs.	four
		Infectious waste.	
		Liquid waste generated from any infected area.	
Q.1	(ix)	Enlist Sources of biomedical waste.	
	Ans.	Sources of biomedical waste	(02
		Hospitals	Marks)
		Health Clinics	For any
		Nursing Homes	four
		Medical Research laboratories	

			Ţ
		Blood banks     Grant Control of the control o	
		Office of physicians, dentists and veterinarians	
		Pharmacies	
Q.1	(x) Ans.	Sate any two features of Biomedical Waste Management of Handling Rule, 1998 Following are the features of Biomedical Waste Management of Handling Rule, 1998  1. Bio-medical waste shall not be mixed with other wastes.  2. Bio-medical waste shall be segregated into containers/bags at the points of generation in accordance with Schedule II prior to its storage transportation, treatment and disposal. The containers shall be labeled according to Schedule III.	(02 Marks) One mark each
Q.1	(xi)	Write any two precautions to be taken during handling and processing of solid waste.	_
	Ans.	<ol> <li>Following are two precautions taken during handling and processing of solid waste</li> <li>Before handling and processing solid waste employees must go through training.</li> <li>Employee must use proper safety aids like hand gloves, goggles etc while handling solid waste.</li> <li>Care must be taken that the waste should not comes in contact with skin.</li> </ol>	(02 Marks) For any two
Q.1	(xii)	Enlist any two methods of mass education in SWM	
	Ans.	Following are the methods of mass education in SWM	
		Use of print media	(02
		Use of TV/Cable TV/ Radio/ Web site	Marks)
		Street plays, Puppet show	For any
		• Posters	two
		Pamphlets	
		Use of hoarding	
		Use of public transport system	
Q.1	(xiii)	Enlist any two benefits of recycling of solid waste.	
	Ans.	Following are the benefits of recycling of solid waste	
		Reduce the amount of waste sent to landfill and incinerators.	(02
		Conserves natural resources such as timber, water and minerals.	Marks)
		Prevents pollution by reducing the need of new raw material.	For any
		Saves energy.	two
		Reduce greenhouse gas emissions.	
Q.1	(xiv)	State any two steps in recycling solid waste	
=	Ans.	Following are the steps in recycling solid waste.	
		Collection and processing	(02
		• Sorting	Marks)
		Manufacturing	For any
		Purchasing new products made from recycled materials	two
		Recycled content product	
		Recycled product	
Q.2	(a)	List the characteristics of solid waste. Explain any two characteristics of solid waste along with solid waste management hierarchy.  Physical characteristics	
		Density	

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

- Moisture Content
- Size
- Field Capacity
- Permeability of compacted wastes
- Porosity

### **Chemical characteristics**

- Lipids
- Carbohydrates
- Proteins
- Heating value
- Natural fibres

**Density:** Density of waste, i.e., its mass per unit volume (kg/m3), is a critical factor in the design of a SWM system, e.g., the design of sanitary landfills, storage, types of collection and transport vehicles, etc. To explain, an efficient operation of a landfill demands compaction of wastes to optimum density. Any normal compaction equipment can achieve reduction in volume of wastes by 75%, which increases an initial density of 100 kg/m3 to 400 kg/m3. In other words, a waste collection vehicle can haul four times the weight of waste in its compacted state than when it is uncompact. A high initial density of waste precludes the achievement of a high compaction ratio and the compaction ratio achieved is no greater than 1.5:1. Significant changes in density occur spontaneously as the waste moves from source to disposal, due to scavenging, handling, wetting and drying by the weather, vibration in the collection vehicle and decomposition.

Moisture content: Moisture content is defined as the ratio of the weight of water (wet weight - dry weight) to the total weight of the wet waste. Moisture increases the weight of solid wastes, and thereby, the cost of collection and transport. In addition, moisture content is a critical determinant in the economic feasibility of waste treatment by incineration, because wet waste consumes energy for evaporation of water and in raising the temperature of water vapour. In the main, wastes should be insulated from rainfall or other extraneous water. We can calculate the moisture percentage, using the formula given below

Moisture content (%) = (Wet weight - Dry weight)\*100/ Wet weight

A typical range of moisture content is 20 to 40%, representing the extremes of wastes in an arid climate and in the wet season of a region of high precipitation. However, values greater than 40% are not uncommon.

**Size:** Measurement of size distribution of particles in waste stream is important because of its significance in the design of mechanical separators and shredders. Generally, the results of size distribution analysis are expressed in the manner used for soil particle analysis. That is to say, they are expressed as a plot of particle size (mm) against percentage, less than a given value.

**Field capacity:** The field capacity of MSW is the total amount of moisture which can be retained in a waste sample subject to gravitational pull. It is a critical measure because water in excess of field capacity will form leachate, and leachate can be a major problem in landfills. Field capacity varies with the degree of applied pressure and the state of decomposition of the wastes.

(01 Mark)

(01 Mark)

(04 Marks) For any two

## MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION (Autonomous)

(ISO/IEC - 27001 - 2013 Certified)

**Permeability of compacted wastes**: The hydraulic conductivity of compacted wastes is an important physical property because it governs the movement of liquids and gases in a landfill. Permeability depends on the other properties of the solid material include pore size distribution, surface area and porosity.

**Porosity:** It represents the amount of voids per unit overall volume of material. The porosity of MSW varies typically from 0.40 to 0.67 depending on the compaction and composition of the waste. Porosity of solid waste n = e/(1+e) Where e is void ratio of solid waste

**Lipids:** This class of compounds includes fats, oils and grease, and the principal sources of lipids are garbage, cooking oils and fats. Lipids have high heating values, about 38,000 kJ/kg (kilojoules per kilogram), which makes waste with high lipid content suitable for energy recovery. Since lipids become liquid at temperatures slightly above ambient, they add to the liquid content during waste decomposition. Though they are biodegradable, the rate of biodegradation is relatively slow because lipids have a low solubility in water.

**Carbohydrates:** These are found primarily in food and yard wastes, which encompass sugar and polymer of sugars (e.g., starch, cellulose, etc.) with general formula (CH2O)x. Carbohydrates are readily biodegraded to products such as carbon dioxide, water and methane. Decomposing carbohydrates attract flies and rats, and therefore, should not be left exposed for long duration.

**Proteins:** These are compounds containing carbon, hydrogen, oxygen and nitrogen, and consist of an organic acid with a substituted amine group (NH2). They are mainly found in food and garden wastes. The partial decomposition of these compounds can result in the production of amines that have unpleasant odours.

**Heating value:** An evaluation of the potential of waste material for use as fuel for incineration requires a determination of its heating value, expressed as kilojoules per kilogram (kJ/kg). The heating value is determined experimentally using the Bomb calorimeter test, in which the heat generated, at a constant temperature of 25C from the combustion of a dry sample is measured. Since the test temperature is below the boiling point of water (100C), the combustion water remains in the liquid state. However, during combustion, the temperature of the combustion gases reaches above 100C, and the resultant water is in the vapour form.

**Natural fibres:** These are found in paper products, food and yard wastes and include the natural compounds, cellulose and lignin, that are resistant to biodegradation. (Note that paper is almost 100% cellulose, cotton over 95% and wood products over 40%.) Because they are a highly combustible solid waste, having a high proportion of paper and wood products, they are suitable for incineration. Calorific values of oven-dried paper products are in the range of 12,000 -18,000 kJ/kg and of wood about 20,000 kJ/kg, i.e., about half that for fuel oil, which is 44,200 kJ/kg.

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

10. Air circulation

### Following are the different methods of composting.

- Manual Composting.
  - 1. Bangalore method
  - 2. Indore method
- Mechanical Composting Dano Process

. Marks)

(02

### **Bangalore method**

This is an anaerobic method of composting. This method saves labour cost because there is no need of turning and regular sprinkling of water.

#### Procedure:

- Spread the moist farm refuse at the bottom of the pit up to one inch.
- Then, spread two inch of cattle dung and urinated mud followed by 1 or 2 inch layer of soil
- This heap is made up to 1.5-2.0 feet above the ground level following above process.
- Finally the heap is covered with 1 inch thick mud.
- After 8-9 months all material decomposes and compost becomes ready for the application.

### **Indore method**

#### Procedure:

- First of all, spread dry wastes with cattle dung and soil in ratio of 4:2:1 up to 2 inch layer in Composting pit.
- Afterwards, sprinkle the water over the materials
- Pit is filled with above materials up to 1 foot above the ground level
- One more layer of bedding material with wood ash and urinated mud should be added.
- The material is turned three times for proper aeration and moisture
- First turning:10-15 days after filling the pits.
- Second turning: 15 days after first turning
- Third turning: After 2 month of second turning

### **Mechanical Composting – Dano Process**

The process of stabilization is expiated by mechanical device of turning the compost. It require small area as compared to manual composting.

The stabilization takes place I 3-6 days.

The operations involved in mechanical composting are:

- Reception of refuse
- Segregation
- Shredding
- Stabilization
- Marketing

### (Students may explain any one method of composting)

(04 Marks for any one)

Q.3	(a) Ans.	State the sources of solid waste. Write impact of solid waste on environment. State the factors affecting generation of solid waste.  Sources of solid wastes in the community are:  1. Residential 2. Commercial 3. Institutional 4. Construction and demolition 5. Municipal services 6. Treatment plant sites 7.Industrial 8. Agricultural 9. Bio medical waste	(02 Marks) For any eight
		Impact of solid waste on Environment:  The decomposition of waste into constituent chemicals is a common source of local environmental pollution. This problem is especially acute in developing nations. Very few existing landfills in the world's poorest countries would meet environmental standards accepted in industrialized nations, and with limited budgets there are likely to be few sites rigorously evaluated prior to use in the future. The problem is again compounded by the issues associated with rapid urbanization. A major environmental concern is gas release by decomposing garbage. Methane is a by-product of the anaerobic respiration of bacteria, and these bacteria thrive in landfills with high amounts of moisture. Methane concentrations can reach up to 50% of the composition of landfill gas at maximum anaerobic decomposition. A second problem with these gasses is their contribution to the enhanced greenhouse gas effect and climate change. Liquid leachate management varies throughout the landfills of the developing world. Leachate poses a threat to local surface and ground water systems. The use of dense clay deposits at the bottom of waste pits, coupled with plastic sheeting type liners to prevent infiltration into the surrounding soil, is generally regarded as the optimum strategy to contain excess liquid. In this way, waste is encouraged to evaporate rather than infiltrate.	(04
		Following are the factors affecting generation of solid waste:  1. Population 2. Urbanization 3. Industrialization 4. Life style 5. Family income 6. Size of family 7. Climatic condition of the area 8. Tourist number. 9. Habits and culture of the people 10. Source reduction / recycling 11. Family income	(02 Marks) For any eight
Q.3	(b) Ans.	State the methods of storage of (MSW) municipal solid waste. State current practice of solid waste management in India in brief. Following are the methods of storage of (MSW)	

		House storage method.	(02
		Command storage method	Marks)
		Current practice of solid waste management in India Generally no bins for the storage of domestic, trade or institutional waste are kept at source. Very few people keep personal bins for the storage of domestic, trade or institutional waste at source.  Under the situation most of the domestic waste as well as waste from shops, offices and establishments including hospitals, nursing homes, hotels, restaurants etc., come on the streets or disposed of in unauthorized public or private open plots even discharged into the drain or water bodies resulting in clogging of drains, pollution of water resources and increase in insanitary conditions in the urban areas.	(Six Marks)
Q.3	(c) Ans.	State the factors affecting selection of site for land filling of solid waste. State the advantages and disadvantages of landfill method.	
		Following are the factors affecting selection of site for land filling  1. Site should be easily approachable.  2. It should be located away from the community area.  3. Sufficient quantity of soil should be available nearby site.  4. Waterlogged and flood prone areas should be avoided.  5. Local climate should be considered while selecting site for land filling.  6. Ground water should be very deep, it should not be less than 5m.  Advantages of Landfill method:  1. Many times landfill is a cheap waste disposal method.  2. Jobs will be created for local people.  3. Verity of solid waste can be disposed off by landfill method.  4. Gases generated from landfill site can be used for heating.  5. The site can be re landscaped once it has been filled.  Disadvantages of Landfill method:  1. The site will look ugly when it is being used for landfill.  2. Dangerous gases are generated from landfill that causes air pollution.  3. Local streams could be polluted with leachate seeping through ground from landfill site.  4. The jobs created in local area are likely to be low paid jobs.  5. The trucks delivering the waste to the site are very big and noisy; they will spoil the peace and quiet in the area.	(04 Marks) For any four (02 Marks) For any four (02 Marks) For any four
Q.4	a) Ans.	<ul> <li>i) State the various ways of solid waste prevention and reduction</li> <li>ii) Draw the organization pattern of solid waste management.</li> <li>i) Various ways of solid waste prevention and reduction</li> <li>1. Purchase items in bulk. Products that are packaged in larger packages typically use less packaging per product than smaller packages. Check this out the next time you are shopping.</li> <li>2. Analyze the size of the packaging for the products you buy. Choose to buy items that use no packaging or a minimal amount of packaging. For example, buy apples from a bin rather than wrapped up on Styrofoam with plastic around them.</li> <li>3. Buy items that are packaged in recycled cartons. This helps to promote recycling.</li> <li>4. Choose to purchase items that are made from recycled products. Most things made from recycled products advertise this fact, so that you know you are helping the</li> </ul>	(04 Marks) For any eight

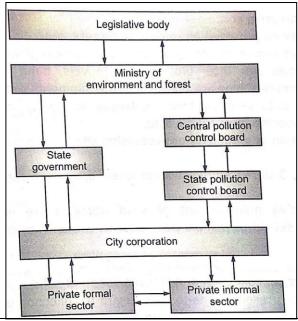

(Autonomous) (ISO/IEC - 27001 - 2013 Certified)

environment when you purchase them.

- **5.** Recycle items rather than sending them to the landfill. Keep a recycle bin or bag in your home to place plastic, paper and cans. Carry these recycle items to your recycling station. Some towns offer curb side recycling.
- **6. Place food scraps in a compost bin.** You can also use newspaper and other biodegradable items to make compost.
- **7. Carry cloth bags to the grocery store or market.** Use these bags in place of plastic or paper bags that will be thrown away. Reuse the cloth bags each time you shop.
- **8.** Give items to charity or sell in a yard sale rather than throwing them away. Sometimes, 1 person's trash is another person's treasure. This is a wonderful way to recycle items.
- **9. Find a way to reuse items rather than throwing them away.** An example would be to wash and reuse plastic containers rather than using plastic baggies and throwing them in the trash.
- **10. Pick up only what you need.** Avoid throwing items away unnecessarily. Borrow items that you might only use occasionally. Try to fix an item rather than throwing it away, or see if someone else can fix it for you.
- **11. Reuse items for a different purpose than originally intended.** For example, make a pencil holder out of a metal can.

**Recharge batteries rather than using disposable.** You will save money in the long run and keep these items out of landfills.

ii) Organization pattern of solid waste management.

(04 Marks)

Q.4 b)

Describe the pyrolysis method of incinerations w.r.t. meaning, principle, merits and demerits.

**Meaning of pyrolysis:** Pyrolysis is also called as destructive distillation or carbonization. It is the process of thermal decomposition of organic matter at high temperature in an inert (oxygen deficient) atmosphere or vacuum, producing a mixture of combustible Carbon monoxide, Methane, Hydrogen, Ethane [CO, CH4, H2, C2H6] and non combustible Carbon

C.) Explain the following: i) Leachate from land filling it) Industrial waste iii) Reuse of solid waste iiv) Purpose of recycling. i. Leachate from land filling: Leachate is the liquid that seeps through solid wastes or other medium and has extracts of dissolved or suspended material from it. Part of the moisture contained in the deposited waste is released under self-weight and flows down. The leachate contains highly polluting TDS, COD, and chlorides etc. causing pollution of ground water. Therefore leachate contro & removal measures are necessary at landfill sites. ii. Industrial Waste: Industrial processes generate waste during the various operations of storage handling packing as well as when the reaction does not occur efficiently. The hazardous characteristics of industrial waste cause environmental pollution. Coal ash, steel plant slag phospogypsum, red mud, lime mud and white sludge are some examples of industrial wastes. iii. Reuse of solid waste: One person's waste material can be useful material for others. Reusing saves money conserves resources and it satisfies the human urge to make things. Efforts should therefore be made to encourage collection of such reusable material through waste collectors, waste producers, NGOs and private sector, instead of allowing reusable waste of land upon the disposal sites. Bottles, cans, tins, drums and cartons can be reused. iv. Purpose of recycling: i)To save raw material resources in production ii)To reduce solid waste in landfills iv)To minimize environmental pollution  Explain disposal and recycling of E-waste.	
i) Leachate from land filling it) Industrial waste iii) Reuse of solid waste iv) Purpose of recycling.  i. Leachate from land filling: Leachate is the liquid that seeps through solid wastes or other medium and has extracts of dissolved or suspended material from it. Part of the moisture contained in the deposited waste is released under self-weight and flows down. The leachate contains highly polluting TDS, COD, and chlorides etc. causing pollution of ground water. Therefore leachate contro & removal measures are necessary at landfill sites.  ii. Industrial Waste: Industrial processes generate waste during the various operations of storage handling packing as well as when the reaction does not occur efficiently. The hazardous characteristics of industrial waste cause environmental pollution. Coal ash, steel plant slag phospogypsum, red mud, lime mud and white sludge are some examples of industrial wastes.  iii. Reuse of solid waste: One person's waste material can be useful material for others. Reusing saves money conserves resources and it satisfies the human urge to make things. Efforts should therefore be made to encourage collection of such reusable material through waste collectors, waste producers, NGOs and private sector, instead of allowing reusable waste of land upon the disposal sites. Bottles, cans, tins, drums and cartons can be reused.  iv. Purpose of recycling:  i)To save raw material resources in production ii)To save energy in production iii)To reduce solid waste in landfills iv)To minimize environmental pollution  Eq.6  Explain disposal and recycling of E-waste.

Q.6 a) Explain disposal and recycling of E-waste.	02 marks
·   ·   ·   ·	
Ans The disposal of E waste is done by Land filling, Incineration & Reuse methods as follows	
i) Land filling: In land filling, trenches are made on flat surfaces. Soil is excavated from	
the trenches and waste material is buried in it, which is covered by thick layer of	f
soil. Secure land filling are provided with some facilities like impervious liner	
made up of plastic o clay, Leachate collection basin that collect and transfer the	
leachate to wastewater treatment plant. Environmental risk from land filling of	
waste cannot be neglected because the condition of land filling site are differen	t <b>06 marks</b>
from a native soil, particularly concerning the leaching behavior of metals.	
ii) Incineration: It is controlled and complete combustion process, in which the waste	
material is burned in specially designed incinerators at a high temperature.	
Advantage of incineration of E waste is the reduction of waste volume and	
utilization of energy content of combustible materials.	
iii) Reuse: It is commonly used for electronic equipment like computers, cell phones	
etc. It constitutes direct second hand use or use after slight modification of	1
original functioning equipment. This reduces E waste volume.	
Recycling of E waste:	

		Monitors, CRT, keyboards, laptops, modems, telephones, hard drives, floppy drives, compact disks, mobiles, fax machines, CPUs, memory chips and cards, connecting cables, can be recycled. Recycling involves, dismantling and recovery of valuable materials. Recycling is the best possible option for the management of E waste because the existing dumping grounds in India are full & overflowing beyond capacity and due to scarcity of lands it is difficult to get new lands.	02 marks
Q.6	b) Ans	Define communicable and non-communicable diseases. Discuss the importance of public involvement and participation in SWM.  i) The definition of communicable and non-communicable diseases is as follows.  Communicable diseases: These are infectious transmissible diseases from person to person by direct contact with an affected individual or his discharges or indirectly by vectors. e.g. diarrhea  Non communicable diseases: These are diseases which are not caused by infectious agents hence non transmissible. E.g. hearing defect  ii) The importance of public involvement & participation can be described as per following points.  1. To increase the awareness of SWM among the people.  2. To promote the principles of Reduction, Reuse, Recycling & Recovery.  3. To reduce littering of waste on streets, drains & open spaces.  4. To plan segregation oh hazardous, non-hazardous; dry wet waste, E waste, BMW & industrial waste.  5. To reduce the environmental pollution.  6. To increase efficiency of planning & implementation of SWM.  7. To improve management strategies with local municipal authorities.  8. To encourage composting & recycling initiatives in public & agencies.	02 marks Any six 01 mark for each
Q.6	c) Ans	<ol> <li>State methods of collecting recyclables. Describe current status of recycling of SW in India.</li> <li>The methods of collecting recyclables are as follows.</li> <li>Curbside collection: In this method the resident in urban or sub urban area sorts recyclable household waste according to type of material in separate bins which are placed on curb side or at collection point weekly or fortnightly which is collected by municipal workers.</li> <li>Buy back centers: Buy back centers established at central locations purchase the cleaned recyclable sorted waste from residents. These centers send this collection to recycling factories.</li> <li>Drop off centers: The collected recyclables is dropped at reprocessing plants directly.</li> <li>Deposit Programs: The resident purchases households after paying deposit amount. After use waste containers are given back to sellers getting back deposit along with bonus point for redemption for next purchase.</li> <li>The current status of recycling of SW in India is as follows.</li> <li>In India at present repair, reprocess &amp; reuse of waste materials is a common practice in un organized manner.</li> <li>Resource recovery is taking place in unrecognized establishments in un organized way.</li> <li>At present recycling of dry recyclables is taking place at household levels.</li> </ol>	04 marks

(Autonomous)

(ISO/IEC - 27001 - 2013 Certified)

- Rag pickers on street, dumping grounds segregate saleable materials such as paper, plastic, glass, metal, textile etc.
   Bhangarwala agents collects dry recyclables from individuals paying some money such as paper, iron, rubber, plastic, glass, furniture, cloths etc.
   These activities are not monitored by government organizations hence it ignores
- social, economic, and environmental & health aspects.

  (NOTE: Credit may be given to any other appropriate explanation.)
