Important Instructions to examiners:

1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate’s answers and model answer.
6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
7) For programming language papers, credit may be given to any other program based on equivalent concept.

</tbody>
</table>
f) **Causes of surface roughness:**
- Vibrations, material of the work piece, type of machining, rigidity of the system consisting of machine tool, fixtures, cutting tool and work, type form material and sharpness of the cutting tool, cutting conditions (speed, feed and depth of cut), type of coolant used

Any four causes ½ mark each

---

g) **RMS value in surface finish:**
- R.M.S. value is defined as the square root of the arithmetic means of the values of the squares of the ordinates of the surface measured from a mean line.

\[
\text{RMS} = \sqrt{\frac{h_1^2 + h_2^2 + h_3^2 + \ldots + h_n^2}{n}}
\]

Note: - formula not essential if written give advantage

---

b) **Mechanical Comparator**

1) Mechanical comparators are robust and compact in design

2) Usually the Mechanical comparators have linear scale.

3) Due to more moving parts the friction is more

**Pneumatic Comparator**

1) Pneumatic Comparators are not portable and compact in design

2) The scale is generally not linear

3) It has few number of moving parts

01 mark each any four points
which reduces the accuracy and in some cases none. Thus the accuracy obtained is more due to absence of friction and inertia.

4) Less degree of magnification as compare to pneumatic comparators. It is possible to obtain high degree of magnification

5) Less costlier as compared to other comparators Cost is high as compared to mechanical comparators

---

Hole Basis system

In hole basis system the hole is kept as the constant and the shaft upper and lower deviation values determine the type of fit. In hole basis system the Lower deviation of the hole will be Zero.

- In this system lower deviation of the hole is Zero i.e the lower limit of hole is the same as basic size.

- The higher limit of hole and the two limits of size for the shaft are then varied to give the desired type of fit.

- The system is denoted by symbol ‘H’.

Hole basis system is preferred over the shaft basis system because holes are machined by standard drills or reamers having fixed dimensions, while the shafts can be turned or ground to any given dimension. Hence it is convenient to produce various sizes of shafts than holes of various sizes.

---

d - Work piece is mounted on a glass plate placed on the table.
- Light from lamp at the extreme right is collimated in the tube connecting the lamp to the center of instrument and is reflected as a parallel beam by the prism at the end of the tube.
- On its way up, this beam collects the image of the object to be inspected and this enters the microscope.
- Before the rays reach the eyepiece, it is turned by another prism. This is shown in Figure.
- For the most effective manipulation, the magnified image of the work is viewed through the eyepiece (or is projected).
- Superimposed on a prepared background engraved on glass disk in the eyepiece.
Explain i) Environmental error ii) Calibration error

Environmental errors:

The measuring instruments are assembled and calibrated in certain environmental conditions and are designed to be used in within certain restricted conditions, but when they are used in different conditions, there are errors in measurement, which are considered to be the environmental errors. Most of the instruments are designed to be used within certain limits of temperature, pressure, humidity, altitude etc and when the limits are extended there are errors in the measuring instruments.

Here are some precautions to be taken to reduce the environmental errors in the instruments:

- Use in the instruments within the specified limits of temperature, pressure and humidity for which the instrument has been designed. These limits are mentioned in the instruments instructions manual.

- If you have to use the instrument beyond the specified limits of environmental conditions, then apply suitable corrections to the recorded measurement.

- One can also calibrate the instrument newly in the new conditions.

- There are some devices that enable applying the compensation automatically.

Calibration error:

The difference between values indicated by an instrument and those that are actual. Normally, a correction card is placed next to the instrument indicating the instrument error. Also called calibration error.

Calibration in measurement technology and metrology is the comparison of measurement values delivered by a device under test with those of a calibration standard of known accuracy. Such a standard could be another measurement device of known accuracy, a device generating the quantity to be measured such as a voltage, sound tone, or a meter ruler.

Any deviation from standard, engraving scales, is considered as calibration error.
b) Draw the diagram indicates 4.32 mm on vernier scale.

![Vernier Scale Reading Diagram](image)

\[ TP = \text{Main Reading} + VSD \\
= 4 + 16 \times 0.02 \\
= 4 + 0.32 \\
= 4.32 \]

04 marks

b) Explain in brief construction and working of sigma comparator.

**Construction and working of Sigma comparator:**

- The Plunger will hold the contact with the work piece, and it is positioned in place with the help of slit diaphragms.
- The plunger will have a notch at its centre as shown in the figure.
- A knife Edge is attached to the plunger to magnify the linear movement of the plunger which is connected to the Cross strip with the help of moving the block.
- The Y-shaped metallic arm is connected to the cross strip to Driving drum. This arm rotated and makes the drum to rotate and hence the pointer will move on the scale.
- The first step of magnification take place at the knife edge and cross strip and the second step of magnification is done at the drum diameter and the pointer length.

![Sigma Comparator Diagram](image)
### d Differentiate between hole basis system and shaft basis system.

<table>
<thead>

Gauges required to build 6.905 mm are: $4.0 + 1.9 + 1.005 = 6.905$
Slip gauge arrangement

By using M112 table we use 1.005, 1.9 and 4.

b) A shaft of 25 + 0.004mm is to be checked by means of GO and NOGO gauge. Design the dimension of gauge required.

- Maximum size = 25 + 0.004 = 25.004
- Minimum size = 25 - 0.004 = 24.996
- GO gauge allows max. shaft dia. of 25.004
- NOGO gauge designed to min. size of 24.996

04 marks (02 mark for each dimension)

c) Write the examples of use of following types of fits.

i) Push fit
   Requires a moderate pressure.
   e.g. gear slip bushing, PVC pipe push fit with solvent

ii) Press fit
    Interference required to maintain this fit
    e.g. bushing, bearing pins, gears, pulleys, shaft collar

iii) Running fit
     Permits free rotation or movement
     e.g. nut bolt assembly, running shaft in bearing.

iv) Wringing fit
    Provides either zero interference or clearance
    e.g. gears of machine tools

01 mark each
d. An angle of 49 degrees 29' 18" is to be developed by using std. angle gauge set of 13 pieces. Calculate the gauges required and sketch the arrangement.

Angle gauge set of 13 pieces

\[
\begin{bmatrix}
1^0 & 3^0 & 9^0 & 27^0 & 41^0 \\
1' & 3' & 9' & 27' & 30''
\end{bmatrix}
\]

\[
49^0 = 41^0 + 9^0 - 1^0; \\
29' = 27' + 3' - 1'; \\
18'' = 18''
\]

Total 7 pieces required to build the given dimension.

Arrangement of angle gauges

---

e. Explain procedure to determine whether the given surface is concave or convex by using optical flat.

**Concave surface:**

If the optical flat is placed on some spherically concave surface. And the contact is made at the central high point and in centre a bright circle will be visible. Around it, there will be concentric dark and bright circular fringes. As the distance from the centre increases, the separation between optical flat and surface keeps on increasing and the fringes become narrow and more closely spaced as shown in fig.
Fringe pattern as observed through optical flat.

**Convex surface:**

To distinguish between the two conditions of convex and concave surfaces one edge of the optical flat is lightly pressed. In case of convex surface, by light pressure the optical flat will rock on a new high spot and the centre of the fringe pattern will move as shown in Fig. Also the outer fringes will move closer together. In case of spherically concave surface, the flat is resting on a line passing around the surface and on lightly pressing the edge of the optical flat, the edge line does not move as the pressure is varied. Rather, light pressure at the centre will cause the optical flat to be deflected and will become more nearly parallel to the concave surface, thus reducing the number of fringes observed.

Thus if by light pressure, the centre of fringes is displaced and the fringes are brought closer, it is convex surface and the level at that place must be lowered down to form a flat surface. If by light pressure the number of fringes is reduced and the fringes move apart, it is concave surface.

Test for convex surface.
a  **Floating Carriage Micrometer:**

The floating carriage micrometer consists of a three units:

a) A casting base carries a pair of centers, on which the treaded work piece is mounted.

b) Another carriage mounted at exactly 90° to the above, which is capable to move parallel to thread axis.

c) Another carriage mounted on the above, which is capable to move at 90° to the thread axis.

- On one end of the upper carriage, there is a fixed anvil and a fiducial indicator which ensures that all the measurements are made at same pressure.

Floating Carriage Micrometer is supplied with the set of master cylinders and wires, which are used to measure effective diameter of threads. Limitation of floating carriage micrometer is, it can be used for measurement of external threads only. Least count of this instrument is 0.002 mm.

b  **Base tangent method**

In this method, the span of a convenient number of teeth is measured with the help of the tangent comparator.

Consider a straight edge ABC being rolled back and forth along a base circle as shown in fig. Its ends thus sweep out opposed involutes $A_2A_1$ and $C_2C_1$ respectively. Thus the measurements made across these opposite involutes by span gauging will be constant.

Length of arc $BD = \text{distance between two opposite involutes}$

\[ = Nm \cos \phi [\tan \phi - \frac{\phi}{2N} + \frac{\pi S}{N}] \]
### Table

<td></td>
</tr>
</tbody>
</table>

**CLA**

\[ CLA = \frac{|h_1 + h_2 + h_3 + \ldots + h_{10}|}{10} = 314/10 = 31.4 \]

**RMS**

\[ RMS = \sqrt{\frac{(h_1)^2 + (h_2)^2 + (h_3)^2 + \ldots + (h_{10})^2}{10}} = 32.50231 \]

### Sketches of fringe patterns and their meanings

**a)** Sketches of fringe patterns and their meanings

- Spherical surface
- Flat but contact not good
- Convex or Concave near the lower right hand edge
- Either a ridge or a valley in the centre
- Perfectly flat surface in close contact with optical flat

### Procedure

**b)** Taper angle of plug gauge

Taper Plug gauge is mounted between sine centers. One roller of sine bar is rested on surface plate, while slip gauges are added below other roller till the tapered edge of gauge becomes parallel to the surface plate. This can be checked using dial indicator and height gauge. Then using sine principle the taper angle can be find out

\[ \sin \theta = \frac{h}{L} \]

Where \( \theta \) = taper angle, \( h \) = Height of slip gauges, \( L \) = center distance between the two rollers of sine bar.
