

SUMMER – 2019 EXAMINATIONS es Model Answer

Subject Code:

22438

# Important Instructions to examiners:

Subject Name: Theory of Machines

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No.	Sub Q. N.	Answer	Marking Scheme
1			10
1	(a)	Attempt any <u>FIVE</u> of the following: (2 x 5 ) Define term 'Kinetics'.	10 02
1			02
	Ans.	(02 Mark for the appropriate significance of Kinetics)	02
		Definition of Kinetics:	02
		It is that branch of Theory of Machines which deals with the inertia forces which arise from	
		the combined effect of the mass and motion of the machine parts.	
1	(b)	List different types of 'Kinematic Pair'.	02
		<ul> <li>(Classification on any 2 basis with sub types, 01 Mark each)</li> <li>Types of Kinematic pairs: <ol> <li>According to the type of relative motion between the elements:</li> <li>Sliding pair.</li> <li>Turning pair.</li> <li>Rolling pair.</li> <li>Screw pair.</li> <li>Spherical pair.</li> </ol> </li> <li>(2) According to the type of contact between the elements: <ol> <li>Lower pair.</li> <li>Lower pair.</li> <li>Higher pair.</li> </ol> </li> <li>[3] According to the type of closure: <ol> <li>Self closed pair.</li> <li>Force - closed pair.</li> </ol> </li> <li>[4] According to Constrained Motion: <ol> <li>Incompletely Constrained</li> <li>Completely Constrained</li> <li>Constrained</li> </ol> </li> </ul>	02

Q.	Sub	Answer	Marking
No.	Q. N.		Scheme
1	(c)	State the relation between relative velocity and motion of link in mechanism.	02
	Ans.	Relation between Relative Velocity and motion of link in mechanism:	
		The relative velocity is the velocity of any point with respect to any other some point on the same link. Let,	02
		V be the relative velocity of one end w.r.t. other end of link in m/sec	
		$\omega$ be the angular motion in rad/sec &	
		r as the length of same link in meter	
		Then, the relation is expressed as;	
1		$V = r x \omega$ m/sec	
1	( <b>d</b> )	List any four applications of 'cam' and 'follower'.	02
	Ans.	(Any four applications, ½ Marks for each)	
		Applications of Cam and Follower:	
		[1] Operating the inlet and exhaust valves of internal combustion engines	
		[2] Used in Automatic attachment of machineries, paper cutting machines	02
		<ul><li>[3] Used in Spinning and weaving textile machineries.</li><li>[4] Used in Feed mechanism of automatic lathes etc.</li></ul>	
		[5] Used in Diesel Fuel Pumps.	
		[6] Used in printing control mechanism	
		[7] Used in wall clock	
1	(0)	[8] Used in feed mechanism of automatic lathe.	02
I	(e)	Define the term 'Dwell' w.r.t. cam profile.	02
	Ans.	Definition of Dwell:	
		It is duration of cam rotation during which there is no motion to the follower. That means	02
		during dwell period though cam rotates but follower remains stationary.	
		<b>OR</b> When the follower is not moving upward and downward even when the cam rotates is	
		called as dwell.	
1	( <b>f</b> )	State the functions of clutches.	02
	Ans.	Functions of Clutches:	
		[1] To engage and disengage output shaft with the engine shaft as and when required.	02
		[2] To engage shafts very smoothly without much slipping of friction surfaces.	
		[3] To transmit power from engine shaft to output shaft without loss.	
		[4] To engage the shafts smoothly without noise and jerk	

Q. No.	Sub Q. N.	Answer	Marking Scheme
1	(g)	Define coefficient of fluctuation of energy.	02
	Ans.	Definition of Coefficient of Fluctuation of Energy:It may be defined as the ratio of the maximum fluctuation of energy to the work doneper cycle.Mathematically it is expressed as; $C_{\rm E} = \frac{\text{Maximum fluctuation of energy}}{\text{Work done per cycle}}$ The work done per cycleThe work done per cycle (in N-m or joules)	02
2		Attempt any THREE of the following: (3 x 4)	12
2	(a)	Draw a neat diagram of 'Scotch Yoke Mechanism'. Explain its constructional features in brief.	04
		Crank (Link 2) Link 1	02 Marks for Labeled Sketch
		<ul> <li>Constructional Features of Scotch Yoke Mechanism:</li> <li>[1] In this mechanism, two sliding pairs and two turning pairs are used. So it is an inversion of Double Slider Crank Chain Mechanism.</li> <li>[2] It consists of following types of links with relative motion as mentioned below; Link 1 (B) – Fixed Link – Guide the Frame Link 2 – Crank – Turning Motion – Rotates about Point B in Link 1 Link 3 - Slider -Sliding Motion</li> </ul>	02 Marks for Constructional Features
		Link 4 – Fixed Link – Frame – Reciprocating Motion [3] The inversion is obtained by fixing either the Link 1 or Link 3.	

Q. No.	Sub Q. N.	Answer	Marking Scheme
2	(a)	Draw a neat diagram of 'Scotch Yoke Mechanism'. Explain its constructional features in brief.	04
	Ans.	[4] When the link 2 (which corresponds to crank) rotates about <i>B</i> as centre, the link 4 (which corresponds to a frame) reciprocates. It is used for converting rotary motion into a reciprocating motion.	
2	(b)	Explain the term: (i) Slip (ii) Creep	04
	Ans.	<b>Slip:</b> The forward motion of the driver without carrying the belt with it or forward motion of the belt without carrying the driven pulley with it, is called slip of the belt. Slip reduces velocity ratio and also power transmission capacity of the belt drive. Less slip in the belt drive is desirable.	
		OR	01
		When belt is transmitted power from driver to driven pulley, there is a loss of motion due to insufficient frictional grip and therefore the speed of driven pulley is less than driver pulley. This is known as <u>Slip of the belt</u> & generally expressed in % Slip of Belt by neglecting thickness of belt is expressed as below;	
		$\frac{N_2}{N_1} = \frac{d_1}{d_2} \left( 1 - \frac{s}{100} \right)$	
		<b>Creep:</b> When the belt passes from the slack side to the tight side, a certain portion of the belt extends and it contracts again when the belt passes from the tight side to slack side. Due to these changes of length, there is a relative motion between the belt and the pulley surfaces. This relative motion is termed as creep.	01
		Creep reduces velocity ratio and also power transmission capacity of the belt drive. Less creep in the belt drive is desirable.	
		Creep of Belt is expressed as below;	01
		$\frac{N_2}{N_1} = \frac{d_1}{d_2} \times \frac{E + \sqrt{\sigma_2}}{E + \sqrt{\sigma_1}}$	
		$\sigma_1$ and $\sigma_2$ = Stress in the belt on the tight and slack side respectively, and	
		E = Young's modulus for the material of the belt.	01

		Poisplacement	J F G H S S S S S S S S S S S S S	7 <sup>1</sup> 8 <sup>1</sup> →	02
2	( <b>d</b> )	Differentiate between belt o	drive and gear drive.		04
	Ans.	Difference between Belt and	d Gear Drive: (Any 04 Points	, 01 Mark for each)	
		Basis	Belt Drive	Gear Drive	
		Power transmitting	Less	High	
		capacity			
		Slip & Creep	Occurs	No	
		Material used	Flexible in nature	Rigid material used	04
		Type of drive Centre distance between	Slip drive Medium or large	Positive drive	
		the shafts	Internation of large	Very less	
		Overload taking capacity	Slips when overloaded	Damages when overloaded	
		Velocity Ratio	Does not remain constant	Remain constant	
		Use	Low to moderate power transmission	High power transmission	

Q.	Sub Q. N.	Answer	Marking Scheme
No. 3	(a)	Draw a neat sketch of 'Locomotive coupler' mechanism. Explain its working in brief.	04
		Link 4       Wheels         Link 3       C         J       C         J       Link 3         Link 1       B         Eigure: Coupler Rod of Locomotive         (Link AD = Link BC = Crank       Link CD = Coupling Rod         Link AB = Fixed Link = Frame)	02
		Working of Coupler Rod of Locomotive: It is an example of Double Crank Mechanism in which, Links AD and BC (having equal length) act as cranks and are connected to the respective wheels. Link CD acts as a coupling rod and link AB is fixed in order to maintain a Constant center to center distance between them. This mechanism is meant for <u>transmitting rotary motion</u> <u>from one wheel to the other wheel.</u>	02
3	<b>(b)</b>	Name the suitable mechanism to be used for following applications:	04
		(Correct Name of Suitable Mechanism for Given Application, 01 Mark for each)	
		S.N. Application Suitable Mechanism	
		(i) Lifting water from well Pendulum pump (Bull Engine)	
			04
		(ii) Connecting misaligned shaft Oldham's coupling	
		(iii) Converting rotary motion into Beam Engine (Crank & Lever Msm) reciprocating motion	
		(iv) Maintain constant relative motion Coupling rod of locomotive between two rotary elements	

Q.	Sub	Answer	Marking
No.	Q. N.		Scheme
3	(c)	Explain the construction of 'Disc Brake' with neat sketch.	04
	Ans.	Construction of Disc Brake: Modern vehicles always equipped with disc brakes on at least the front two wheels. It consists of mainly 3 parts, [1] Rotor [2] Caliper [3] Brake pads In between each piston and disc, friction pad held in position by springs. Higher applied forces can be used in disc brakes than in drum brakes, because the design of the rotor is stronger than the design of the drum. Due to this, large resistance is carried by flat disc. In this, Flat plate disc with flat friction pad are used against heavy drum. Friction surface directly exposed to air cooling which results better (faster) heat	02
		dissipation. Caliper Brake Brake Pads Rotor Figure: Disc Brake	02
3	( <b>d</b> )	Draw basic 'cam-follower' diagram showing its terminology (Minimum four terms)	04
	Ans.	Basic Cam Follower Profile:	02 Marks for Cam Profile 02 Marks for 04 Terms indicating on it

Q. No.	Sub Q. N.	Answer	Marking Scheme
3	(e)	State the necessity of Balancing. List different types of Balancing Methods.	04
		(02 Marks for Necessity, 02 Marks for Types)	
		Necessity of Balancing:	
		[1] The high speed of engines and other machines is a common phenomenon now-a-	
		days. It is, therefore, very essential that all the rotating and reciprocating parts should be completely balanced as far as possible.	
		[2] If these parts are not properly balanced, the dynamic forces are set up. These	02
		forces not only increase the loads on bearings and stresses in the various members,	
		but also produce unpleasant and even dangerous vibrations.	
		[3] The balancing of unbalanced forces is caused by rotating masses, in order to	
		minimize pressure on the main bearings when an engine is running.	
		Types of Balancing Methods:	
		[1] Balancing of rotating masses:	
		(a) Balancing of a single rotating mass by a single rotating mass in the same plane	
		(b) Balancing of a single rotating mass by two masses rotating in the different planes	
		(c) Balancing of different masses rotating in the same plane	02
		(d) Balancing of different masses rotating in the different planes	
		[2] Balancing of Several masses revolving in same plane:

	Ans.	(03 Marks for neat labeled sketch, 03 Marks for Working principle in brief)	03 Marks for neat labeled sketch
		Centrifugal clutch.	
		Working Principle of Centrifugal Clutch: The centrifugal clutch uses <i>centrifugal force</i> , instead of spring force for keeping it in engaged position. Also, it does not require clutch pedal for operating the clutch. The clutch is operated automatically depending upon the engine speed. The vehicle can be stopped in gear without stalling the engine. Similarly the vehicle can be started in any gear by pressing the accelerator pedal. This makes the driving operation very easy. OR	03 Marks for Approp riate principl e of workin g

6	N. (b)	The centrifugal clutches are usually incorporated into the motor pulleys. It consists of a number of shoes on the inside of a rim of the pulley, as shown in Fig. The outer surface of the shoes is covered with a friction material. These shoes, which can move radially in guides, are held against the boss (or spider) on the driving shaft by means of	
		springs. The springs exert a radially inward force which is assumed constant. The mass of the shoe, when revolving, causes it to exert a radially outward force (i.e. centrifugal force). The magnitude of this centrifugal force depends upon the speed at which the shoe is revolving. A little consideration will show that when the centrifugal force is less	
		than the spring force, the shoe remains in the same position as when the driving shaft was stationary, but when the centrifugal force is equal to the spring force, the shoe is just floating. When the centrifugal force exceeds the spring force, the shoe moves outward and comes into contact with the driven member and presses against it. The force with which the shoe presses against the driven member is the difference of the	
		centrifugal force and the spring force. The increase of speed causes the shoe to press harder and enables more torque to be transmitted.	
6	(c)	The weights of four masse A, B, C, D are 200 Kg, 300 Kg, 240 Kg and 260 Kg respectively. The corresponding radii of rotation are 200 mm, 150 mm, 250 mm and 300 mm respectively and the angle between successive masses are 45°, 75° and 135°. Find the position and magnitude of the balance weight required if its radius of rotation is 200 mm.	06
	Ans.	Given Data: (Either solve by Analytical Or Graphical Method) Given : $m_1 = 200 \text{ kg}$ ; $m_2 = 300 \text{ kg}$ ; $m_3 = 240 \text{ kg}$ ; $m_4 = 260 \text{ kg}$ ; $r_1 = 0.2 \text{ m}$ ; $r_2 = 0.15 \text{ m}$ ; $r_3 = 0.25 \text{ m}$ ; $r_4 = 0.3 \text{ m}$ ; $\theta_1 = 0^\circ$ ; $\theta_2 = 45^\circ$ ; $\theta_3 = 45^\circ + 75^\circ = 120^\circ$ ; $\theta_4 = 45^\circ + 75^\circ + 135^\circ = 255^\circ$ ; $r = 0.2 \text{ m}$	01 Mark for Given Data
